CHAPTER 1

P. E. 1.1

(a) $\quad A + B = (1,0,3) + (5,2,-6) = (6,2,-3)$

$\quad |A + B| = \sqrt{36+4+9} = \underline{\underline{7}}$

(b) $\quad 5A - B = (5,0,15) - (5,2,-6) = \underline{\underline{(0,-2,21)}}$

(c) The component of A along $\mathbf{a}_y$ is $\quad A_y = \underline{\underline{0}}$

(d) $\quad 3A + B = (3,0,9) + (5,2,-6) = (8,2,3)$
A unit vector parallel to this vector is

$\quad a_{11} = \dfrac{(8,2,3)}{\sqrt{64+4+9}}$

$\quad = \underline{\underline{\pm(0.9117a_x + 0.2279a_y + 0.3419a_z)}}$

P. E. 1.2 (a) The distance vector

$$r_{QR} = r_R - r_Q = (0,3,8) - (2,4,6)$$
$$= \underline{\underline{-2a_x - a_y + 2a_z}}$$

(b) The distance between Q and R is

$$|r_{QR}| = \sqrt{4+1+4} = \underline{\underline{3}}$$

(c) Vector $r_{QP} = r_P - r_Q' = (1,-3,5) - (2,4,6) = (-1,-7,-1)$

$$\cos\theta_{PQR} = \frac{r_{QR} \cdot r_{QP}}{|r_{QR}||r_{QP}|} = \frac{7}{3\sqrt{51}}$$

$$\theta_{PQR} = \underline{\underline{70.93°}}$$

(d) Area $= \frac{1}{2}|r_{QR} \times r_{QP}| = \frac{1}{2}|(15,-4,13)|$

$\quad = \underline{\underline{10.12}}$

P. E. 1.3   Consider the figure shown below:

$$U_Z = U_P + U_W = -350a_X + \frac{40}{\sqrt{2}}\left(-a_X + a_Y\right)$$

$$= -378a_X + 28.28a_Y$$

or

$$\mathbf{u} = 379.3\angle 175.72°$$

P. E. 1.4

At point $(1,0)$, $\mathbf{G} = \mathbf{a_y}$;
at point $(0,1)$, $\mathbf{G} = -\mathbf{a_x}$;
at point $(2,0)$, $\mathbf{G} = \mathbf{a_y}$;

at point $(1,1)$, $\mathbf{G} = \dfrac{-a_x + a_y}{\sqrt{2}}$; and so on.

It is evident that $\mathbf{G}$ is a unit vector at each point. Thus the vector field $\mathbf{G}$ is as sketched in Fig.1.8.

P. E. 1.5

Using the dot product,

$$\cos\theta_{AB} = \frac{\mathbf{A} \bullet \mathbf{B}}{AB} = \frac{-13}{\sqrt{10}\sqrt{65}} = -\sqrt{\frac{13}{50}}$$

or using the cross product,

$$\sin\theta_{AB} = \frac{|\mathbf{A} x \mathbf{B}|}{AB} = \sqrt{\frac{481}{650}}$$

Either way.

$$\underline{\underline{\theta_{AB} = 120.66°}}$$

P. E. 1.6

(a) $E_F = (E \cdot a_F)a_F = \dfrac{(E \cdot F)F}{|F|^2} = \dfrac{-10(4,-10,5)}{141}$

$\qquad = -0.2837a_x + 0.7092a_y - 0.3546a_z$

(b) $E \times F = \begin{vmatrix} a_x & a_y & a_z \\ 0 & 3 & 4 \\ 4 & -10 & 5 \end{vmatrix} = (55,16,-12)$

$\qquad a_{E \times F} = \pm(0.9398, 0.2734, -0.205)$

P. E. 1.7 $\qquad a + b + c = 0$ showing that a, b, and c form the sides of a triangle.

$\qquad a \cdot b = 0,$
hence it is a right angle triangle.

$$\text{Area} = \frac{1}{2}|a \times b| = \frac{1}{2}|b \times c| = \frac{1}{2}|c \times a|$$

$$\frac{1}{2}|a \times b| = \frac{1}{2}\begin{vmatrix} 4 & 0 & -1 \\ 1 & 3 & 4 \end{vmatrix} = \frac{1}{2}|(3,-17,12)|$$

$$\text{Area} = \frac{1}{2}\sqrt{9 + 289 + 144} = 10.51$$

P. E. 1.8

(a) $P_1P_2 = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2}$

$\qquad = \sqrt{25 + 4 + 64} = 9.644$

(b) $r_P = r_{P_1} + \lambda(r_{P_2} - r_{P_1})$

$\qquad = (1,2,-3) + \lambda(-5,-2,8)$

$\qquad = (1 - 5\lambda, 2 - 2\lambda, -3 + 8\lambda).$

(c) The shortest distance is

$\qquad d = P_1P_3 \sin\theta = |P_1P_3 \times a_{P_1P_2}|$

$\qquad = \dfrac{1}{\sqrt{93}}\begin{vmatrix} 6 & -3 & 5 \\ -5 & -2 & 8 \end{vmatrix}$

$\qquad = \dfrac{1}{\sqrt{93}}|(-14,-73,-27)| = 8.2$

4

Prob.1.1

$r = (-3,2,2) - (2,4,4) = (-5,-2,-2)$

$a_r = \dfrac{r}{|r|} = \dfrac{(-5,-2,-2)}{\sqrt{25+4+4}} = -0.8703a_x - 0.3482a_y - 0.3482a_z$

Prob. 1.2

(a) $A + 2B = (2,5,-3) + (6,-8,0) = \underline{\underline{8a_x - 3a_y - 3a_z}}$

(b) $A - 5C = (2,5,-3) - (5,5,5) = (-3,0,-8)$

$|A - 5C| = \sqrt{9+0+64} = \underline{\underline{8.544}}$

(c) $kB = 3ka_x - 4ka_y$

$|kB| = \sqrt{9k^2 + 16k^2} = \pm 5k = 2$

$\Rightarrow \underline{\underline{k = \pm 0.4}}$

(d) $A \cdot B = (2,5,-3) \cdot (3,-4,0) = 6 - 20 + 0 = 14$

$A \times B = \begin{vmatrix} 2 & 5 & -3 \\ 3 & -4 & 0 \end{vmatrix} = (-12,-9,-23)$

$\dfrac{A \times B}{A \cdot B} = \left(\dfrac{12}{14}, \dfrac{9}{14}, \dfrac{23}{14}\right) = \underline{\underline{0.8571a_x + 0.6428a_y + 1.642a_z}}$

Prob. 1.3

(a) $A - 2B = (2,1,-3) - (0,2,-2) = (2,-1,-1)$

$A - 2B + C = \underline{\underline{5a_x + 4a_y + 6a_z}}$

(b) $A + B = (2,2,-4)$

$C - 4(A + B) = (3,5,7) - (8,8,-16) = \underline{\underline{-5a_x - 3a_y + 23a_z}}$

(c) $2A - 3B = (4,2,-6) - (0,3,-3) = (4,-1,-3)$

$|C| = \sqrt{9+25+49} = 9.11$

$\dfrac{2A - 3B}{|C|} = \underline{\underline{0.439a_x - 0.11a_y - 0.3293a_z}}$

(d) $A \cdot C = 6 + 5 - 21 = -10$,

$\quad |B| = \sqrt{2}$

$\quad A \cdot C - |B|^2 = -10 + 2 = \underline{\underline{-8}}$

(e) $\frac{1}{3}A + \frac{1}{4}C = \left(\frac{2}{3}, \frac{1}{3}, -1\right) + \left(\frac{3}{4}, \frac{5}{4}, \frac{7}{4}\right) = (1.4167, 1.5833, 0.75)$

$\quad \frac{1}{2}B \times \left(\frac{1}{3}A + \frac{1}{4}C\right) = \frac{1}{2}\begin{vmatrix} 0 & 1 & -1 \\ 1.4167 & 1.5833 & 0.75 \end{vmatrix} = \underline{\underline{1.1667a_x - 0.7084a_y - 0.7084a_z}}$

Prob.1.4

(a) $\quad T = \underline{(3, -2, 1)}$ and $S = \underline{(4, 6, 2)}$

(b) $r_{TS} = r_s - r_t = (4, 6, 2) - (3, -2, 1) = \underline{a_x + 8a_y + a_z}$

(c) distance $= |r_{TS}| = \sqrt{1 + 64 + 1} = \underline{8.124}$ m

Prob. 1.5

Let $D = \alpha A + \beta B + C$

$\quad = (5\alpha - \beta + 8)a_x + (3\alpha + 4\beta + 2)a_y + (-2\alpha + 6\beta)a_z$

$\quad D_x = 0 \rightarrow 5\alpha - \beta + 8 = 0 \qquad\qquad (1)$

$\quad D_z = 0 \rightarrow -2\alpha + 6\beta = 0 \rightarrow \alpha = 3\beta \qquad (2)$

Substituting (2) into (1),

$$15\beta - \beta + 8 = 0 \rightarrow \beta = -\frac{8}{14} = -\frac{4}{7}$$

Thus

$$\underline{\underline{\alpha = -\frac{12}{7}, \beta = -\frac{4}{7}}}$$

Prob. 1.6

$$A \cdot B = 0 \rightarrow 0 = 3\alpha + \beta - 24 \qquad (1)$$
$$A \cdot C = 0 \rightarrow 0 = 5\alpha - 2 + 4\gamma \qquad (2)$$
$$B \cdot C = 0 \rightarrow 0 = 15 - 2\beta - 6\gamma \qquad (3)$$

In matrix form,

$$\begin{bmatrix} 24 \\ 2 \\ 15 \end{bmatrix} = \begin{bmatrix} 3 & 1 & 0 \\ 5 & 0 & 4 \\ 0 & 2 & 6 \end{bmatrix} \begin{bmatrix} \alpha \\ \beta \\ \gamma \end{bmatrix}$$

$$\Delta = \begin{vmatrix} 3 & 1 & 0 \\ 5 & 0 & 4 \\ 0 & 2 & 6 \end{vmatrix} = 3(0-8) - 1(30-0) + 0(10-0) = -24 - 30 = -54$$

$$\Delta_1 = \begin{vmatrix} 24 & 1 & 0 \\ 2 & 0 & 4 \\ 15 & 2 & 6 \end{vmatrix} = -24 \times 8 - (12 - 60) = -144$$

$$\Delta_2 = \begin{vmatrix} 3 & 24 & 0 \\ 5 & 2 & 4 \\ 0 & 15 & 6 \end{vmatrix} = 3(12 - 60) - 24 \times 30 = -864$$

$$\Delta_3 = \begin{vmatrix} 3 & 1 & 24 \\ 5 & 0 & 2 \\ 0 & 2 & 15 \end{vmatrix} = -12 - 75 + 240 = 153$$

$$\alpha = \frac{\Delta_1}{\Delta} = \frac{-144}{-54} = \underline{2.667}$$

$$\beta = \frac{\Delta_2}{\Delta} = \frac{-864}{-54} = \underline{\underline{16}}$$

$$\gamma = \frac{\Delta_3}{\Delta} = \frac{153}{-54} = \underline{\underline{-2.833}}$$

Prob. 1.7

(a) $A \cdot B = AB \cos \theta_{AB}$

$A \times B = AB \sin \theta_{AB} a_n$

$(A \cdot B)^2 + |A \times B|^2 = (AB)^2 (\cos^2 \theta_{AB} + \sin^2 \theta_{AB}) = (AB)^2$

(b) $a_x \cdot (a_y \times a_z) = a_x \cdot a_x = 1$. Hence,

$$\frac{a_y \times a_z}{a_x \cdot a_y \times a_z} = \frac{a_x}{1} = a_x$$

$$\frac{a_z \times a_x}{a_x \cdot a_y \times a_z} = \frac{a_y}{1} = a_y$$

$$\frac{a_x \times a_y}{a_x \cdot a_y \times a_z} = \frac{a_z}{1} = a_z$$

Prob. 1.8

(a) $P + Q = (2,2,0), P + Q - R = (3,1,-2)$

$|P + Q - R| = \sqrt{9 + 1 + 4} = \sqrt{14} = \underline{\underline{3.742}}$

(b) $P \cdot Q \times R = \begin{vmatrix} -2 & -1 & -2 \\ 4 & 3 & 2 \\ -1 & 1 & 2 \end{vmatrix} = -2(6-2) + (8+2) - 2(4+3) = -8 + 10 - 14 = \underline{\underline{-12}}$

$Q \times R = \begin{vmatrix} 4 & 3 & 2 \\ -1 & 1 & 2 \end{vmatrix} = (4,-10,7)$

$P \cdot Q \times R = (-2,-1,-2) \cdot (4,-10,7) = -8 + 10 - 14 = \underline{\underline{-12}}$

(c) $Q \times P = \begin{vmatrix} 4 & 3 & 2 \\ -2 & -1 & -2 \end{vmatrix} = (-4,4,2)$

$Q \times P \cdot R = (-4,4,2) \cdot (-1,1,2) = 4 + 4 + 4 = \underline{\underline{12}}$

or $\quad Q \times P \cdot R = R \cdot Q \times P = \begin{vmatrix} -1 & 1 & 2 \\ 4 & 3 & 2 \\ -2 & -1 & -2 \end{vmatrix} = -(-6+2) - (-8+4) + 2(-4+6) = \underline{\underline{12}}$

(d) $(P \times Q) \cdot (Q \times R) = (4,-4,2) \cdot (4,-10,7) = 16 + 40 - 14 = \underline{\underline{42}}$

(e) $(P \times Q) \times (Q \times R) = \begin{vmatrix} 4 & -4 & 2 \\ 4 & -10 & 7 \end{vmatrix} = \underline{\underline{-48a_x - 36a_y - 24a_z}}$

(f) $\cos\theta_{PR} = \frac{P \cdot R}{|P||R|} = \frac{(2-1-4)}{\sqrt{4+1+4}\sqrt{1+1+4}} = \frac{-3}{3\sqrt{6}} = \frac{-1}{\sqrt{6}}$

$\underline{\underline{\theta_{PR} = 114.1°}}$

8

(g) $\sin\theta_{PQ} = \dfrac{|P \times Q|}{|P||Q|} = \dfrac{\sqrt{16+16+4}}{3\sqrt{16+9+4}} = \dfrac{6}{3\sqrt{29}}$

$\theta_{PQ} = \underline{\underline{21.8°}}$

Prob. 1.9

(a) $T_s = T \cdot a_s = \dfrac{T \cdot S}{|S|} = \dfrac{(2,-6,-3)\cdot(1,2,1)}{\sqrt{6}} = \dfrac{-7}{\sqrt{6}} = \underline{\underline{-2.8577}}$

(b) $S_T = (S \cdot a_T)a_T = \dfrac{(S\cdot T)T}{T^2} = \dfrac{-7(2,-6,3)}{7^2}$

$= \underline{\underline{-0.2857a_x + 0.8571a_y - 0.4286a_z}}$

(c) $\sin\theta_{TS} = \dfrac{|T \times S|}{|T||S|} = \begin{vmatrix} 2 & -6 & 3 \\ 1 & 2 & 1 \end{vmatrix} = \dfrac{|(-12,1,10)|}{7\sqrt{6}} = \dfrac{\sqrt{245}}{7\sqrt{6}} = 0.9129$

$\Rightarrow \theta_{TS} = \underline{\underline{65.91°}}$

Prob. 1.10

(a) $A_B = A \cdot a_B = \dfrac{AB}{|B|} = \dfrac{-1+12+15}{\sqrt{1+4+9}} = \dfrac{26}{\sqrt{14}} = \underline{\underline{6.95}}$

(b) $B_A = (B \cdot a_A)a_A = \dfrac{(B \cdot A)A}{|A|^2} = \dfrac{26(-1,6,5)}{(1+36+25)}$

$= \underline{\underline{-0.4193a_x + 2.516a_y + 2.097a_z}}$

(c) $\cos\theta_{AB} = \dfrac{A \cdot B}{|A||B|} = \dfrac{26}{\sqrt{62}\sqrt{1+4+9}} = \dfrac{26}{\sqrt{62}\sqrt{14}}$

$\theta_{AB} = \underline{\underline{28.05°}}$

(d) $A \times B = \begin{vmatrix} -1 & 6 & 5 \\ 1 & 2 & 3 \end{vmatrix} = 8a_x + 8a_y - 8a_z$

A unit vector perpendicular to both A and B is

$a_{A \times B} = \dfrac{8a_x + 8a_y - 8a_z}{8\sqrt{1+1+1}} = \dfrac{a_x + a_y - a_z}{\sqrt{3}} = \underline{\underline{0.577a_x + 0.577a_y - 0.577a_z}}$

Prob. 1.11

$$\cos\theta = \frac{H \cdot a_x}{|H|} = \frac{3}{\sqrt{9+25+64}} = \frac{3}{98}$$

$$\theta_x = \underline{\underline{72.36°}}$$

$$\cos\theta = \frac{H \cdot a_y}{|H|} = \frac{5}{\sqrt{9+25+64}} = \frac{5}{98}$$

$$\theta_y = \underline{\underline{59.66°}}$$

$$\cos\theta = \frac{H \cdot a_z}{|H|} = \frac{-8}{\sqrt{9+25+64}} = \frac{-8}{98}$$

$$\theta_z = \underline{\underline{143.91°}}$$

Prob. 1.12

$$Q \times R = \begin{vmatrix} 1 & 1 & 1 \\ 2 & 0 & 3 \end{vmatrix} = (3,-1,-2)$$

$$P \cdot (Q \times R) = (2,-1,1) \cdot (3,-1,2) = 6+1-2 = \underline{\underline{5}}$$

Prob. 1.13

(a) Using the fact that

$$(A \times B) \times C = (A \cdot C)B - (B \cdot C)A,$$

we get

$$A \times (A \times B) = -(A \times B) \times A = \underline{\underline{(B \cdot A)A - (A \cdot A)B}}$$

(b) $A \times (A \times (A \times B)) = A \times [(A \cdot B)A - (A \cdot A)B]$

$$= \underline{\underline{(A \cdot B)(A \times A) - (A \cdot A)(A \times B)}}$$

Prob. 1.14

$$A \cdot (B \times C) = \begin{vmatrix} A_x & A_y & A_z \\ B_x & B_y & B_z \\ C_x & C_y & C_z \end{vmatrix}, \qquad (A \times B) \cdot C = \begin{vmatrix} A_x & A_y & A_z \\ B_x & B_y & B_z \\ C_x & C_y & C_z \end{vmatrix}$$

Hence, $A \cdot (B \times C) = (A \times B) \cdot C$

Prob. 1.15

$$P_1P_2 = r_{P_2} - r_{P_1} = (-6,0,-3)$$

$$P_1P_3 = r_{P_3} - r_{P_1} = (1,5,-6)$$

$$P_1P_2 \times P_1P_3 = \begin{vmatrix} -6 & 0 & -3 \\ 1 & 5 & -6 \end{vmatrix} = (15,39,-30)$$

Area of the triangle $= \dfrac{1}{2}|P_1P_2 \times P_1P_3| = \dfrac{1}{2}\sqrt{15^2 + 39^2 + 30^2} = \underline{\underline{25.72}}$

Prob. 1.16

Let $P_1 = (4,1,-3)$, $P_2 = (-2, 5, 4)$, and $P_3 = (0, 1, 6)$

$$a = r_{P_2} - r_{P_1} = (-2,5,4) - (4,1,-3) = (-6,4,7)$$

$$b = r_{P_3} - r_{P_2} = (0,1,6) - (-2,5,4) = (2,-4,2)$$

$$c = r_{P_1} - r_{P_3} = (4,1,-3) - (0,1,6) = (4,0,-9)$$

Note that $a + b + c = 0$

$$a \cdot b = ab\cos(180 - \gamma) \rightarrow -\cos\gamma = \frac{a \cdot b}{|a||b|} = \frac{-12 - 16 + 14}{\sqrt{101}\sqrt{24}}$$

$$\gamma = \cos^{-1}\frac{14}{\sqrt{101}\sqrt{24}} = \underline{\underline{73.47°}}$$

$$b \cdot c = bc\cos(180 - \beta) \rightarrow -\cos\beta = \frac{b \cdot c}{|b||c|} = \frac{8 + 0 - 18}{\sqrt{24}\sqrt{97}}$$

$$\beta = \cos^{-1}\frac{10}{\sqrt{24}\sqrt{97}} = \underline{\underline{78.04°}}$$

$$a \cdot c = ac\cos(180 - \alpha) \rightarrow -\cos\alpha = \frac{a \cdot c}{|a||c|} = \frac{-24 + 0 - 63}{\sqrt{101}\sqrt{97}}$$

$$\alpha = \cos^{-1}\frac{87}{\sqrt{101}\sqrt{97}} = \underline{\underline{28.48°}}$$

Prob. 1.17

(a) $r_{PQ} = r_Q - r_P = (2,-1,3) - (-1,4,8) = (3,-5,-5)$

$r_{PQ} = |r_{PQ}| = \sqrt{9 + 25 + 25} = \underline{7.681}$

(b) $r_{PR} = r_R - r_P = (-1,2,3) - (-1,4,8) = (0,-2,-5) = \underline{\underline{-2a_y - 5a_z}}$

(c) $r_{QP} = -r_{PQ} = -3a_x + 5a_y + 5a_z$

$r_{QR} = r_Q - r_R = (2,-1,3) - (-1,2,3) = 3a_x - 3a_y$

$\cos\theta = \dfrac{r_{QP} \cdot r_{QR}}{|r_{QP}||r_{QR}|} = \dfrac{-9-15}{\sqrt{9+25+25}\sqrt{9+9}} = \dfrac{-24}{\sqrt{18}\sqrt{59}}$

$\underline{\underline{\theta = 137.43°}}$

(d) Area $= \dfrac{1}{2}|r_{QP} \times r_{QR}|$

$r_{QP} \times r_{QR} = \begin{vmatrix} -3 & 5 & 5 \\ 3 & -3 & 0 \end{vmatrix} = 15a_x + 15a_y - 6a_z$

Area $= \dfrac{1}{2}\sqrt{15^2 + 15^2 + 6^2} = \underline{\underline{11.02}}$

(e) Perimeter $= QP + PR + RQ = r_{QP} + r_{PR} + r_{QR}$

$= \sqrt{59} + \sqrt{4+25} + \sqrt{18}$

$= 7.681 + 5.385 + 4.243$

$= \underline{\underline{17.31}}$

Prob. 1.18

(a) Let $A = (A,B,C)$ and $r = (x,y,z)$

$(r-A)\cdot A = (x-A)A + (y-B)B + (z-C)C$

$= Ax + By + Cz + D$

where $D = -A^2 - B^2 - C^2$. Hence,

$(r-A)\cdot A = 0 \rightarrow Ax + By + Cz + D = 0$

which is the equation of a plane.

(b) $(r-A)\cdot r = (x-A)x + (y-B)y + (z-C)z$

If $(r-A)\cdot r = 0$, then

$x^2 + y^2 + z^2 - Ax - By - Cz = 0$

which is the equation of a sphere whose surface touches the origin.

(c) See parts (a) and (b).

Prob. 1.19

(a) Let P and Q be as shown below:

$$|P| = \cos^2\theta_1 + \sin^2\theta_1 = 1, |Q| = \cos^2\theta_2 + \sin^2\theta_2 = 1,$$
Hence **P** and **Q** are unit vectors.

(b) $P \cdot Q = (1)(1)\cos(\theta_2 - \theta_1)$

But $P \cdot Q = \cos\theta_1\cos\theta_2 + \sin\theta_1\sin\theta_2$. Thus,

$\underline{\cos(\theta_2 - \theta_1) = \cos\theta_1\cos\theta_2 + \sin\theta_1\sin\theta_2}$

Let $P_1 = P = \cos\theta_1 a_x + \sin\theta_1 a_y$ and

$Q_1 = \cos\theta_2 a_x - \sin\theta_2 a_y$.

P_1 and Q_1 are unit vectors as shown below:

$P_1 \cdot Q_1 = (1)(1)\cos(\theta_1 + \theta_2)$
But $P_1 \cdot Q_1 = \cos\theta_1\cos\theta_2 - \sin\theta_1\sin\theta_2$,
$\underline{\cos(\theta_2 + \theta_1) = \cos\theta_1\cos\theta_2 - \sin\theta_1\sin\theta_2}$

Alternatively, we can obtain this formula from the previous one by replacing θ_2 by $-\theta_2$ in **Q**.

(c)

$$\frac{1}{2}|P - Q| = \frac{1}{2}|(\cos\theta_1 - \cos\theta_2)a_x + (\sin\theta_1 - \sin\theta_2)a_y$$

$$= \frac{1}{2}\sqrt{\cos^2\theta_1 + \sin^2\theta_1 + \cos^2\theta_2 + \sin^2\theta_2 - 2\cos\theta_1\cos\theta_2 - 2\sin\theta_1\sin\theta_2}$$

$$= \frac{1}{2}\sqrt{2 - 2(\cos\theta_1\cos\theta_2 + \sin\theta_1\sin\theta_2)} = \frac{1}{2}\sqrt{2 - 2\cos(\theta_2 - \theta_1)}$$

Let $\theta_2 - \theta_1 = \theta$, the angle between **P** and **Q**.

$$\frac{1}{2}|P - Q| = \frac{1}{2}\sqrt{2 - 2\cos\theta}$$

But $\cos 2A = 1 - 2\sin^2 A$.

$$\frac{1}{2}|P - Q| = \frac{1}{2}\sqrt{2 - 2 + 4\sin^2\theta/2} = \sin\theta/2$$

Thus,

$$\frac{1}{2}|P - Q| = |\sin\frac{\theta_2 - \theta_1}{2}|$$

CHAPTER 2

P. E. 2.1

(a) At $P(1,3,5)$, $x = 1$, $y = 3$, $z = 5$,

$$\rho = \sqrt{x^2 + y^2} = \sqrt{10}, \qquad z = 5, \qquad \phi = \tan^{-1} y/x = 3$$

$$P(\rho,\phi,z) = P(\sqrt{10}, \tan^{-1} 3, 5) = \underline{\underline{P(3.162, 71.6^{\circ}, 5)}}$$

Spherical system:

$$r = \sqrt{x^2 + y^2 + z^2} = \sqrt{35} = 5.916$$

$$r = \sqrt{x^2 + y^2 + z^2} = \sqrt{35} = 5.916$$

$$\theta = \tan^{-1}\sqrt{x^2 + y^2}/z = \tan^{-1}\sqrt{10}/5 = \tan^{-1} 0.6325 = 32.31^{\circ}$$

$$P(r,\theta,\varphi) = \underline{\underline{P(5.916, 32.31^{\circ}, 71.56^{\circ})}}$$

At $T(0,-4,3)$, $x = 0$ $y = -4$, $z = 3$;

$$\rho = \sqrt{x^2 + y^2} = 4, z = 3, \varphi = \tan^{-1} y/x = \tan^{-1} -4/0 = 270^{\circ}$$

$$\underline{\underline{T(\rho,\varphi,z) = T(4, 270^{\circ}, 3).}}$$

Spherical system:

$$r = \sqrt{x^2 + y^2 + z^2} = 5, \theta = \tan^{-1}\rho/z = \tan^{-1} 4/3 = 53.13^{\circ}.$$

$$\underline{\underline{T(r,\theta,\varphi) = T(5, 53.13^{\circ}, 270^{\circ}).}}$$

At $S(-3-4-10)$, $x = -3$, $y = -4$, $z = -10$;

$$\rho = \sqrt{x^2 + y^2} = 5, \phi = \tan^{-1} -4/-3 = 233.1^{\circ}$$

$$\underline{\underline{S(\rho,\phi,z) = S(5, 233.1, -10).}}$$

Spherical system:

$$r = \sqrt{x^2 + y^2 + z^2} = 5\sqrt{5} = 11.18.$$

$$\theta = \tan^{-1}\frac{\rho}{z} = \tan^{-1} 5/-10 = 153.43^{\circ};$$

$$\underline{\underline{S(r,\theta,\phi) = S(11.18, 153.43^{\circ}, 233.1^{\circ}).}}$$

(b)   In Cylindrical system, $\rho = \sqrt{x^2 + y^2}$; $yz = z\rho \sin\theta$,

$$Q_r = \frac{\rho}{\sqrt{\rho^2 + z^2}}; \qquad Q_y = 0; \qquad Q_z = \frac{z\rho \sin\phi}{\sqrt{\rho^2 + z^2}};$$

$$\begin{bmatrix} Q_\rho \\ Q_\phi \\ Q_z \end{bmatrix} = \begin{bmatrix} \cos\phi & \sin\phi & 0 \\ -\sin\phi & \cos\phi & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} Q_x \\ 0 \\ Q_z \end{bmatrix};$$

$$Q_\rho = Q_x \cos\phi = \frac{\rho\cos\phi}{\sqrt{\rho^2 + z^2}}, \qquad Q_\phi = -Q_x \sin\phi = \frac{-\rho\sin\phi}{\sqrt{\rho^2 + z^2}}$$

Hence,

$$\bar{Q} = \frac{\rho}{\sqrt{x^2 + z^2}}(\cos\phi\, \bar{a}_\rho, -\sin\phi\, a_\phi, -z\sin\phi\, \bar{a}_z).$$

In Spherical coordinates:

$$Q_x = \frac{r\sin\phi}{r} = \sin\phi;$$

$$Q_z = -r\sin\phi\sin\theta\, r\cos\theta\, \frac{1}{r} = -r\sin\theta\cos\theta\sin\phi.$$

$$\begin{bmatrix} Q_r \\ Q_\theta \\ Q_\phi \end{bmatrix} = \begin{bmatrix} \sin\theta\cos\phi & \sin\theta\sin\phi & \cos\theta \\ \cos\theta\cos\phi & \cos\theta\sin\phi & -\sin\phi \\ -\sin\phi & \cos\phi & 0 \end{bmatrix} \begin{bmatrix} Q_x \\ 0 \\ Q_z \end{bmatrix};$$

$$Q_r = Q_x \sin\theta\cos\phi + Q_z \cos\theta = \sin^2\theta\cos\phi - r\sin\theta\cos^2\theta\sin\phi.$$

$$Q_\theta = Q_x \cos\theta\cos\phi - Q_z \sin\theta = \sin\theta\cos\theta\cos\phi + r\sin^2\theta\cos\theta\sin\phi.$$

$$Q_\phi = -Q_x \sin\phi = -\sin\theta\sin\phi.$$

$$\therefore \bar{Q} = \sin\theta\left(\sin\theta\cos\phi - r\cos^2\theta\sin\phi\right)\bar{a}_r + \sin\theta\cos\phi(\cos\phi + r\sin\theta\sin\phi)\bar{a}_\theta - \sin\theta\sin\phi\, \bar{a}_\phi$$

At T :

$$\bar{Q}(x,y,z) = \frac{4}{5}\bar{a}_x + \frac{12}{5}\bar{a}_z = 0.8\,\bar{a}_x + 2.4\,\bar{a}_z;$$

$$\bar{Q}(\rho,\phi,z) = \frac{4}{5}(\cos 270°\, \bar{a}_\rho - \sin 270°\, \bar{a}_\phi - 3\sin 270°\, \bar{a}_z$$

$$= 0.8\,\bar{a}_\phi + 2.4\,\bar{a}_z;$$

$$\bar{Q}(r,\theta,\phi) = \frac{4}{5}\left(0 - \frac{45}{25}(-1)\right)\bar{a}_r + \frac{4}{5}\left(\frac{3}{5}\right)\left(0 - \frac{20}{5}(-1)\right)\bar{a}_\theta - \frac{4}{5}(-1)\bar{a}_\phi$$

$$= \frac{36}{25}\bar{a}_r + \frac{48}{25}\bar{a}_\theta + \frac{4}{5}\bar{a}_\phi = 1.44\,a_r + 1.92\,a_\theta + 0.8\,a_\phi;$$

Note, that the magnitude of vector Q = 2.53 in all 3 cases above.

P.E. 2.2 (a)

$$\begin{bmatrix} A_x \\ A_y \\ A_z \end{bmatrix} = \begin{bmatrix} \cos\phi & -\sin\phi & 0 \\ \sin\phi & \cos\phi & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \rho z \sin\phi \\ 3\rho \cos\phi \\ \rho \cos\phi \sin\phi \end{bmatrix}$$

$$\bar{A} = (\rho z \cos\phi \sin\phi - 3\rho \cos\phi \sin\phi)\bar{a}_x + (\rho z \sin^2\phi + 3\rho \cos^2\phi)\bar{a}_y + \rho \cos\phi \sin\phi \, \bar{a}_z.$$

But $\rho = \sqrt{x^2 + y^2}$, $\tan\phi = \dfrac{y}{x}$, $\cos\phi = \dfrac{x}{\sqrt{x^2 + y^2}}$, $\sin\phi = \dfrac{y}{\sqrt{x^2 + y^2}}$;

Substituting all this yields:

$$\bar{A} = \frac{1}{\sqrt{x^2 + y^2}}\left[(xyz - 3xy)\bar{a}_x + (zy^2 + 3x^2)\bar{a}_y + xy\bar{a}_z\right].$$

$$\begin{bmatrix} B_x \\ B_y \\ B_z \end{bmatrix} = \begin{bmatrix} \sin\theta\cos\phi & \cos\theta\cos\phi & -\sin\phi \\ \sin\theta\sin\phi & \cos\theta\sin\phi & \cos\phi \\ \cos\theta & -\sin\theta & 0 \end{bmatrix} \begin{bmatrix} r^2 \\ 0 \\ \sin\theta \end{bmatrix}$$

Since $r = \sqrt{x^2 + y^2 + z^2}$, $\tan\theta = \dfrac{\sqrt{x^2 + y^2}}{z}$, $\tan\phi = \dfrac{y}{z}$;

and $\sin\theta = \dfrac{\sqrt{x^2 + y^2}}{\sqrt{x^2 + y^2 + z^2}}$, $\cos\theta = \dfrac{z}{\sqrt{x^2 + y^2 + z^2}}$;

and $\sin\phi = \dfrac{y}{\sqrt{x^2 + y^2}}$, $\cos\phi = \dfrac{x}{\sqrt{x^2 + y^2}}$;

$B_x = r^2\sin\theta\cos\phi - \sin\theta\sin\phi = rx - \dfrac{y}{r} = \dfrac{1}{r}(r^2 x - y).$

$B_y = r^2\sin\theta\sin\phi + \sin\theta\cos\phi = ry + \dfrac{y}{x} = \dfrac{1}{r}(r^2 y + x).$

$B_z = r^2\cos\theta = rz = \dfrac{1}{r}(r^2 z).$

Hence,

$$B = \frac{1}{\sqrt{x^2 + y^2 + z^2}}\left[\{x(x^2 + y^2 + z^2) - y\}a_x + \{y(x^2 + y^2 + z^2) + x\}\bar{a}_y + z(x^2 + y^2 + z^2)a_z\right].$$

For $\bar{A_1}$, $z = 2$, $d\bar{S} = \rho\, d\phi\, d\rho\, \bar{a}_z$,

$$\overline{A}_1 = \int\limits_{\rho=0}^{1} \int\limits_{\phi=0}^{\pi/2} \rho^2 z(\cos\phi + \sin\phi)\,d\phi\,d\rho\,\overline{a}_z = (2)\frac{\rho^3}{3}\Big|_0^1 \left(\sin\phi - \cos\phi\right)\Big|_0^{\pi/2}\overline{a}_z$$

$$= \frac{2}{3}(1 - 0 - 0 + 1)\overline{a}_z = \frac{4}{3}\overline{a}_z$$

For $\overline{A}_2$, $z = 0$, $d\overline{S} = \rho\,d\phi(-\overline{a}_z)$,

$$\overline{A}_2 = -\int\limits_{\rho=0}^{1} \int\limits_{\phi=0}^{\pi/2} \rho^2 z(\cos\phi + \sin\phi)\,d\phi\,d\rho\,\overline{a}_z = 0$$

For A_3 $\rho = 1$, $d\overline{S} = \rho\,d\phi\,dz\,\overline{a}_\rho$

$$\overline{A}_3 = \int\limits_{z=0}^{z=2} \int\limits_{\phi=0}^{\frac{\pi}{2}} \rho^2 z(\cos\phi + \sin\phi)\,d\phi\,dz\,\overline{a}_\rho$$

$$= (1^2)\frac{z^2}{2}\Big|_0^2 (1 + 1)\,\overline{a}_\rho = 4\overline{a}_\rho$$

For A_4, $\phi = \dfrac{\pi}{2}$, $d\overline{S} = d\rho\,dz\,\overline{a}_\phi$

$$A_4 = \int\limits_{\rho=0}^{1} \int\limits_{z=0}^{2} \rho\,z(\cos\phi + \sin\phi)\,d\rho\,dz\,\overline{a}_\phi$$

$$A_5 = -\overline{a}_\phi$$

Thus, $\overline{A} = \int V\,d\overline{S} = \dfrac{4}{3}\overline{a}_z + 0 + 4\overline{a}_\phi - \overline{a}_\phi = \underline{\underline{4\overline{a}_\rho + 1.333\,\overline{a}_z}}$

Prob. 3.38

Let $\psi = \oint F \cdot d\bar{S} = \psi_t + \psi_b + \psi_o + \psi_i$

where $\psi_t, \psi_b, \psi_o, \psi_i$ are the fluxes through the top surface, bottom surface, outer surface ($\rho = 3$), and inner surface respectively.

For the top surface, $d\bar{S} = \rho\, d\phi\, d\rho\, \bar{a}_z,\qquad z = 5;$

$\bar{F} \cdot d\bar{S} = \rho^2 z\, d\phi\, dz.$ Hence:

$$\psi_t = \int_{\rho=2}^{3}\int_{\phi=0}^{2\pi}\rho^2 z\, d\phi\, dz\Big|_{z=5} = \frac{190\,\pi}{3}$$

$$\nabla \times \bar{u} = \nabla \times (\bar{\omega} \times \bar{r})$$

$$\nabla \times (\bar{\omega} \times \bar{r}) = \bar{\omega}(\nabla \bullet \bar{r}) - \bar{r}(\nabla \bullet \bar{\omega}) + (r \bullet \nabla)\bar{\omega} - (\bar{\omega} \bullet \nabla)\bar{r}$$

$$= \bar{\omega}(3) - \bar{\omega} = 2\bar{\omega}$$

or $\bar{\omega} = \frac{1}{2}\nabla \times \bar{u}$.

Alternatively, let $x = r\cos\omega\, t, \quad y = r\sin\omega\, t$

$$\bar{u} = \frac{\partial x}{\partial t}\bar{a}_x + \frac{\partial y}{\partial t}\bar{a}_y$$

$$\nabla \times \bar{u} = \begin{vmatrix} \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ -\omega y & \omega x & 0 \end{vmatrix} = 2\omega\,\bar{a}_z = 2\omega$$

i.e., $\bar{\omega} = \frac{1}{2}\nabla \times \bar{u}$

Prob 3.42

Let $\bar{A} = U\nabla V$ and apply Stokes' theorem.

$$\int_L U\nabla V \bullet d\bar{l} = \int \nabla X (U\nabla V) \bullet d\bar{S}$$

$$= \int (\nabla U X \nabla V)d\bar{S} + \int U(\nabla X \nabla V) \bullet d\bar{S}$$

But $\nabla X \nabla V = 0$. Hence,

$$\int_L U \nabla V \cdot d\bar{l} = \int_s (\nabla U \times \nabla V) \cdot d\bar{S}$$

Similarly, we can show that

$$\int_L V \nabla U \cdot d\bar{l} = \int (\nabla V \times \nabla U) \cdot d\bar{S} - \int (\nabla U \times \nabla V) \cdot d\bar{S}$$

Thus, $\int_L U \nabla V \cdot d\bar{l} = -\int_L V \nabla U \cdot d\bar{l}$

By divergence theorem,

$$\int \bar{A} \cdot d\bar{S} = \int \nabla \cdot \bar{A} \, dv$$

$$\nabla \cdot \bar{A} = \frac{\partial Ax}{\partial x} + \frac{\partial Ay}{\partial y} + \frac{\partial Az}{\partial z}$$

$$= \frac{\partial}{\partial x}(xr^n) + \frac{\partial}{\partial y}(yr^n) + \frac{\partial}{\partial z}(zr^n)$$

$$= r^n + 2x^2(\frac{n}{2})(x^2 + y^2 + z^2)^{n/2-1}$$

$$= 3r^n + n(x^2 + y^2 + z^2)r^{n-1}$$

$$= (3 + n)r^n$$

Thus, $\oint r^n \bar{r} d\bar{s} = \int (3 + n)r^n dV$

$$T\cos\theta = mg$$

Hence, $\quad \tan\theta \cos 30° = \dfrac{3q^2}{8\pi\varepsilon_0 d^2} mg$

But $\quad \sin\theta = \dfrac{h}{l} = \dfrac{d}{\sqrt{3}\ l} \quad \tan\theta = \dfrac{\dfrac{d}{\sqrt{3}}}{\sqrt{L^2 - \dfrac{d^2}{3}}}$

Thus, $\quad \dfrac{\dfrac{d}{\sqrt{3}}(\dfrac{\sqrt{3}}{2})}{\sqrt{L^2 - \dfrac{d^2}{3}}} = \dfrac{3q^2}{8\pi\varepsilon_0 d^2 mg}$

CHAPTER 6

P. E. 6.1

$$\nabla^2 V = -\frac{\rho}{\varepsilon} \quad \longrightarrow \quad \frac{d^2 V}{dx^2} = -\frac{\rho_o x}{\varepsilon_o}$$

$$V = -\frac{\rho_o x^3}{6\varepsilon a} + Ax + B$$

$$E = -\frac{dV}{dx} a_x = \left(\frac{\rho_o x^2}{2\varepsilon a} - A\right) a_x$$

If $E = 0$ at $x = 0$, then

$$0 = 0 - A \quad \longrightarrow \quad A = 0$$

If $V = 0$ at $x = a$, then

$$0 = -\frac{\rho_o a^3}{6\varepsilon a} + B \quad \longrightarrow \quad B = \frac{\rho_o a^2}{6\varepsilon}$$

Thus

$$V = \frac{\rho_o}{6\varepsilon a}(a^3 - x^3), \quad E = \frac{\rho_o x^2}{2\varepsilon a} a_x$$

P. E. 6.2

$$V_1 = A_1 x + B_1, \quad V_2 = A_2 x + B_2$$

$$V_1(x = d) = V_o = A_1 d + B_1 \quad \longrightarrow \quad B_1 = V_o - A_1 d$$

$$V_1(x = 0) = 0 = 0 + B_2 \quad \longrightarrow \quad B_2 = 0$$

$$V_1(x = a) = V_2(x = a) \quad \longrightarrow \quad A_1 + B_1 = A_2 a$$

$$D_{1n} = D_{2n} \quad \longrightarrow \quad \varepsilon_1 A_1 = \varepsilon_2 A_2 \quad \longrightarrow \quad A_2 = \frac{\varepsilon_1}{\varepsilon_2} A_1$$

$$A_1 a + V_o - A_1 d = \frac{\varepsilon_1}{\varepsilon_2} a A_1 \quad \longrightarrow \quad V_o = A_1 \left(-a + d + \frac{\varepsilon_1}{\varepsilon_2} a\right)$$

or

$$A_1 = \frac{V_o}{d - a + \varepsilon_1 a / \varepsilon_2}, \quad A_2 = \frac{\varepsilon_1}{\varepsilon_2} A_1 \frac{\varepsilon_1 V_o}{\varepsilon_2 d - \varepsilon_2 a + \varepsilon_1 a}$$

Hence

$$E_1 = -A_1 a_x = \frac{-V_o a_x}{d - a + \varepsilon_1 a / \varepsilon_2}, \quad E_2 = -A_2 a_x = \frac{-V_o a_x}{a + \varepsilon_2 d / \varepsilon_1 - \varepsilon_2 a / \varepsilon_1}$$

P. E. 6.3   From Example 6.3,

$$E = -\frac{V_o}{\rho\phi_o}a_\phi, \qquad D = \varepsilon_o E$$

$$\rho_s = D_n(\phi = 0) = -\frac{V_o\varepsilon}{\rho\phi_o}$$

The charge on the plate $\phi = 0$ is

$$Q = \int \rho_s dS = -\frac{V_o\varepsilon}{\phi_o}\int_{z=0}^{L}\int_{\rho=a}^{b}\frac{1}{\rho}dzd\rho = -\frac{V_o\varepsilon}{\phi_o}L\ln(b/a)$$

$$C = \frac{|Q|}{V_o} = \frac{\varepsilon L}{\phi_o}\ln\frac{b}{a}$$

$$a\sin\frac{45^o}{2} = 2 \quad\longrightarrow\quad a = \frac{2}{\sin 22.5^o} = 5.226 \text{ mm}$$

$$C = \frac{1.5x10^{-9}}{36\pi x\frac{\pi}{4}}5\ln\frac{1000}{5.226} = 444 \text{ pF}$$

$$Q = CV_o = 444x10^{-12} \, x50 = \underline{\underline{22.2 \text{ nC}}}$$

P. E. 6.4   From Example 6.4,

$$V_o = 50, \quad \theta_1 = \pi/2, \quad \theta_2 = 45^o, \quad r = \sqrt{3^2+4^2+2^2} = \sqrt{29}, \quad \theta = \tan^{-1}\frac{\rho}{z} = \frac{5}{2} \quad\longrightarrow\quad \theta = 68.2^o$$

$$V = \frac{50\ln(\tan 34.1^o)}{\tan(22.5^o)} = \underline{\underline{22.13 \text{ V}}}, \qquad E = \frac{-50a_\theta}{\sqrt{29}\sin 68.2^o \ln\tan(22.5^o)} = \underline{\underline{11.36a_\theta \text{ V}/m}}$$

P. E. 6.5

$$E = -\nabla V = -\frac{\partial V}{\partial x}a_x - \frac{\partial V}{\partial y}a_y$$

$$= -\frac{4V_o}{b}\sum_{n=odd}^{\infty}\frac{1}{\sinh n\pi a/b}\Big[\cos(n\pi x/b)\sinh(n\pi y/b)\,a_x + \sin(n\pi x/b)\cosh(n\pi y/b)a_y\Big]$$

(a) At $(x,y) = (a, a/2)$,

$$V = \frac{400}{\pi}(0.3775 - 0.0313 + 0.00394 - 0.000584 + ...) = \underline{44.51} \text{ V}$$

$$E = 0a_x + (-115.12 + 19.127 - 3.9431 + 0.8192 - 0.1703 + 0.035 - 0.0094 + ...)a_y$$
$$= -99.25a_y \text{ V} / \text{m}$$

(b) At $(x,y) = (3a/2, a/4)$,

$$V = \frac{400}{\pi}(0.1238 + 0.00626 - 0.00383 + 0.000264 + ...) = \underline{16.50} \text{ V}$$

$$E = (24.757 - 3.7358 - 0.3834 - 0.0369 + 0.00351 - 0.00033 + ...)a_x$$
$$+ (-66.25 - 4.518 + 0.3988 + 0.03722 - 0.00352 - 0.000333 + ...)a_y$$
$$= 20.68a_x - 70.34a_y \text{ V} / \text{m}$$

P. E. 6.6

$$V(y = a) = V_o \sin(7\pi x / b) = \sum_{n=1}^{\infty} c_n \sin(n\pi x / b) \sinh(n\pi a / b)$$

By equating coefficients, we notice that $c_n = 0$ for $n \neq 7$. For n=7,

$$V_o \sin(7\pi x / b) = c_7 \sin(7\pi x / b) \sinh(7\pi a / b) \longrightarrow c_7 = \frac{V_o}{\sinh(7\pi a / b)}$$

Hence

$$V(x,y) = \frac{V_o}{\sinh(7\pi a / b)} \sin(7\pi x / b) \sinh(7\pi y / b)$$

P. E. 6.7 Let $.V(r,\theta,\phi) = R(r)F(\theta)\Phi(\phi)$.
Substituting this in Laplace's equation gives

$$\frac{\Phi F}{r^2}\frac{d}{dr}\left(r^2\frac{dR}{dr}\right) + \frac{R\Phi}{r^2 \sin\theta}\frac{d}{d\theta}\left(\sin\theta\frac{dF}{d\theta}\right) + \frac{RF}{r^2 \sin^2\theta}\frac{d^2\Phi}{d\phi^2} = 0$$

Dividing by $RF\Phi / r^2 \sin^2\theta$ gives

$$\frac{\sin^2\theta}{R}\frac{d}{dr}(r^2 R') + \frac{\sin\theta}{F}\frac{d}{d\theta}(\sin\theta F') = -\frac{1}{\Phi}\frac{d^2\Phi}{d\phi^2} = \lambda^2$$

$$\Phi'' + \lambda^2\Phi = 0$$

$$\frac{1}{R}\frac{d}{dr}(r^2 R') = \frac{\lambda^2}{\sin^2\theta} - \frac{1}{F\sin\theta}\frac{d}{d\theta}(\sin\theta\, F') = \mu^2$$

$$2R' + r^2 R'' = \mu^2 R$$

or

$$R'' + \frac{2}{r}R' - \frac{\mu^2}{r^2}R = 0$$

$$\frac{\sin\theta}{F}\frac{d}{d\theta}(\sin\theta\, F') - \lambda^2 + \mu^2\sin^2\theta = 0$$

or

$$F'' + \cot\theta\, F' + (\mu^2 - \lambda^2\, cosec^2\theta)F = 0$$

P. E. 6.8 (a) Th is similar to Example 6.8(a) except that here $0 < \phi < 2\pi$ instead of $0 < \phi < \pi/2$. Hence

$$I = \frac{2\pi t V_o \sigma}{\ln(b/a)} \qquad \text{and} \qquad R = \frac{V_o}{I} = \frac{\ln\frac{b}{a}}{2\pi t\sigma}$$

(b) This to similar to Example 6.8(b) except that here $0 < \phi < 2\pi$. Hence

$$I = \frac{V_o\sigma}{t}\int_a^b\int_0^{2\pi}\rho\, d\rho\, d\phi = \frac{V_o\sigma\pi(b^2 - a^2)}{t}$$

and $\quad R = \frac{V_o}{I} = \frac{t}{\sigma\pi(b^2 - a^2)}$

P. E. 6.9 From Example 6.9,

$$J_1 = \frac{\sigma_1 V_o}{\rho\ln\frac{b}{a}}, \qquad J_2 = \frac{\sigma_2 V_o}{\rho\ln\frac{b}{a}}$$

$$I = \int J \bullet dS = \int_{z=0}^{l}\left[\int_{\phi=0}^{\pi} J_1\rho\, d\phi + \int_{\phi=\pi}^{2\pi} J_2\rho\, d\phi\right]dz = \frac{V_o l}{\ln\frac{b}{a}}\left[\pi\sigma_1 + \pi\sigma_2\right]$$

$$R = \frac{V_o}{I} = \frac{\ln\dfrac{b}{a}}{\pi l\left[\sigma_1 + \sigma_2\right]}$$

P. E. 6.10 (a) $C = \dfrac{4\pi\varepsilon}{\dfrac{1}{a} - \dfrac{1}{b}}$, C_1 and C_2 are in series.

$$C_1 = 4\pi x \frac{10^{-9}}{36\pi}\left(\frac{2.5}{\dfrac{10^3}{2} - \dfrac{10^3}{3}}\right) = 5/3 \text{ pF}, \qquad C_1 = 4\pi x \frac{10^{-9}}{36\pi}\left(\frac{3.5}{\dfrac{10^3}{1} - \dfrac{10^3}{2}}\right) = 7/9 \text{ pF}$$

$$C = \frac{C_1 C_2}{C_1 + C_2} = \frac{(5/3)(7/9)}{(5/3) + (7/9)} = \underline{0.53 \text{ pF}}$$

(b) $C = \dfrac{2\pi\varepsilon}{\dfrac{1}{a} - \dfrac{1}{b}}$, C_1 and C_2 are in parallel.

$$C_1 = 2\pi x \frac{10^{-9}}{36\pi}\left(\frac{2.5}{\dfrac{10^3}{1} - \dfrac{10^3}{3}}\right) = 5/24 \text{ pF}, \qquad C_2 = 2\pi x \frac{10^{-9}}{36\pi}\left(\frac{3.5}{\dfrac{10^3}{1} - \dfrac{10^3}{3}}\right) = 7/24 \text{ pF}$$

$$C = C_1 + C_2 = \underline{0.5 \text{ pF}}$$

P. E. 6.11 As in Example 6.8, assuming $V(\rho = a) = 0$, $V(\rho = b) = V_o$,

$$V = V_o \frac{\ln\rho/a}{\ln b/a}, \qquad E = -\nabla V = -\frac{V_o}{\rho \ln b/a} a_\rho$$

$$Q = \int \varepsilon E \bullet dS = \frac{V_o \varepsilon}{\ln b/a} \int_{z=0}^{l} \int_{\phi=0}^{2\pi} \frac{1}{\rho} dz\rho d\phi = \frac{V_o 2\pi\varepsilon L}{\ln b/a}$$

$$C = \frac{Q}{V_o} = \frac{2\pi\varepsilon L}{\underline{\ln b/a}}$$

P. E. 6.12 (a) C_1 and C_2 are in series.

$$C_1 = \frac{2\pi\varepsilon_{r1}\varepsilon_o}{\ln c/a} = \frac{2\pi x 2.5}{\ln 2/1}\frac{10^{-9}}{36\pi} = 200 \text{ pF/m}, \qquad C_2 = \frac{2\pi\varepsilon_{r2}\varepsilon_o}{\ln b/c} = \frac{2\pi x 3.5}{\ln 3/2}\frac{10^{-9}}{36\pi} = 480 \text{ pF/m}$$

$$C = \frac{C_1 C_2}{C_1 + C_2} = \frac{200 \times 480}{200 + 480} = 141.12 \text{ pF}$$

$$C_T = Cl = \underline{1.41} \text{ nF}$$

(b) C_1 and C_2 are in parallel.

$$C = C_1 + C_2 = \frac{\pi \varepsilon_{r1} \varepsilon_o}{\ln b/a} + \frac{\pi \varepsilon_{r2} \varepsilon_o}{\ln b/a} = \frac{\pi (\varepsilon_{r1} + \varepsilon_{r2}) \varepsilon_o}{\ln b/a} = \frac{6\pi}{\ln 3/7} \frac{10^{-9}}{36\pi} = 151.7 \text{ pF/m}$$

$$C_T = Cl = \underline{1.52} \text{ nF}$$

P. E. 6.13 Instead of Eq. (6.31), we now have

$$V = -\int_b^a \frac{Qdr}{4\pi\varepsilon r^2} = -\int_b^a \frac{Qdr}{4\pi \frac{10\varepsilon_o}{r} r^2} = -\frac{Q}{40\pi\varepsilon_o} \ln b/a$$

$$C = \frac{Q}{|V|} = \frac{40\pi}{\ln 4/1.5} \frac{10^{-9}}{36\pi} = \underline{\underline{1.13 \text{ nF}}}$$

P. E. 6.14 Let

$$F = F_1 + F_2 + F_3 + F_4 + F_5$$

where F_i, $i = 1,2,...,5$ are shown on in the figure below.

$$F = -\frac{Q^2}{4\pi\varepsilon_o r^2} + \frac{Q^2(a_x \sin 30^o + a_y \cos 30^o)}{4\pi\varepsilon_o (r \cos 30^o)^2} - \frac{Q^2(a_x \cos 30^o + a_y \sin 30^o)}{4\pi\varepsilon_o (2r)^2} + \frac{Q^2 a_x}{4\pi\varepsilon_o (r \cos 30^o)^2}$$

$$= 9x10^{-5}\left[a_x\left(2 - \frac{5\sqrt{3}}{8}\right) + a_y\left(\frac{4\sqrt{3} - 5}{8}\right)\right] = 82.57a_x + 21.69a_y \ \mu N$$

$\underline{|F| = 85.37 \ \mu N}$

Prob. 6.1

$$\rho_v = -\varepsilon_o \nabla^2 V = -12xz\varepsilon_o$$

At P,

$$\rho_v = 60\varepsilon_o = 60x\frac{10^{-9}}{36\pi} = 530.5 \ pC/m^3$$

Prob. 6.2

$$\nabla^2 V = \frac{\partial^2 V}{\partial x^2} + \frac{\partial^2 V}{\partial y^2} = -n^2 V + n^2 V = \underline{\underline{0}}$$

Prob. 6.10 (a)

$$\frac{\partial V}{\partial x} = 4xyz, \qquad \frac{\partial^2 V}{\partial x^2} = 4yz$$

$$\frac{\partial V}{\partial y} = 2x^2 z - 3y^2 z, \qquad \frac{\partial^2 V}{\partial y^2} = -6yz$$

$$\frac{\partial V}{\partial z} = 2x^2 y - y^3, \qquad \frac{\partial^2 V}{\partial z^2} = 0$$

$$\nabla^2 V = 4yz - 6yz + 0 = -2yz$$

$\nabla^2 V \neq 0$, V <u>does not</u> satisfy Laplace's equation.

(b)

$$\nabla^2 V = -\frac{\rho_v}{\varepsilon} = -2yz \longrightarrow \rho_v = 2yz\varepsilon$$

$$Q = \int \rho_v dv = \int_0^1 \int_0^1 \int_0^1 (2yz\varepsilon)dxdydz = 2\varepsilon(1)\frac{y^2}{2}\Big|_0^1 \frac{z^2}{2}\Big|_0^1 = \varepsilon/2 = 2\varepsilon_o/2 = \varepsilon_o$$

$\underline{Q = 8.854 \text{ pC}}$

Prob. 6.11

$$\nabla^2 V = \frac{d^2V}{dz^2} = 0 \quad \longrightarrow \quad V = Az + B$$

When z=0, V = 0 $\longrightarrow$ B=0

When z=d, V = V_0 $\longrightarrow$ V_0=Ad or A = V_0/d

Hence,

$$V = \frac{V_o z}{d}$$

$$E = -\nabla V = -\frac{dV}{dz}a_z = -\frac{V_o}{d}a_z$$

$$D = \varepsilon E = -\varepsilon_o \varepsilon_r \frac{V_o}{d}a_z$$

Since $V_0 = 50$ V and d = 2mm,

$\underline{V = 25z \text{ kV,}}$ $\underline{E = -25a_z \text{ kV/m}}$

$$D = -\frac{10^{-9}}{36\pi}(1.5)25x10^3 a_z = \underline{\underline{-332a_z \text{ nC}/m^2}}$$

$\rho_s = D_n = \underline{\pm 332 \text{ nC}/m^2}$

The surface charge density is positive on the plate at z=d and negative on the plate at z=0.

Prob. 6.12 From Example 6.8, solving $\nabla^2 V = 0$ when $V = V(\rho)$ leads to

$$V = \frac{V_o \ln \rho/a}{\ln b/a}$$

$$E = -\nabla V = -\frac{V_o}{\rho \ln b/a}a_\rho, \qquad D = \varepsilon E = -\frac{\varepsilon_o \varepsilon_r V_o}{\rho \ln b/a}a_\rho$$

$$\rho_s = D_n = \pm\frac{\varepsilon_o \varepsilon_r V_o}{\rho \ln b/a}\Bigg|_{\rho=a,b}$$

In this case, V_0=100 V, b=5mm, a=15mm, $\varepsilon_r = 2$. Hence at $\rho = 10$mm,

$$V = \frac{100 \ln 10/5}{\ln 15/5} = \underline{\underline{36.91 \text{ V}}}$$

$$E = -\frac{100}{10 \times 10^{-3} \ln 3} a_\rho = \underline{\underline{-9.102 a_\rho}}$$

$$D = -9.102 \times 10^3 \times \frac{10^{-9}}{36\pi} 2 a_\rho = \underline{\underline{-161 a_\rho \text{ nC}/\text{m}^2}}$$

$$\rho_s (\rho = 5\text{mm}) = \frac{10^{-9}}{36\pi}(2)\frac{10^5}{5 \ln 3} = \underline{\underline{322 \text{ nC}/\text{m}^2}}$$

$$\rho_s (\rho = 15\text{mm}) = -\frac{10^{-9}}{36\pi}(2)\frac{10^5}{15 \ln 3} = \underline{\underline{-107.3 \text{ nC}/\text{m}^2}}$$

Prob. 6.13

$$\nabla^2 V = \frac{1}{\rho}\frac{\partial}{\partial\rho}\left(\rho\frac{\partial V}{\partial\rho}\right) = 0 \qquad \longrightarrow \qquad V = A\ln\rho + B$$

Let ρ be in cm.

$$V(\rho = 2) = 60 \qquad \longrightarrow \qquad 60 = A\ln 2 + B$$
$$V(\rho = 6) = -20 \qquad \longrightarrow \qquad -20 = A\ln 6 + B$$

Thus, $A = -72.82$, $B = 110.47$, and

$$V = 110.47 - 72.82\ln\rho$$

$$E = -\frac{dV}{d\rho}a_\rho = -\frac{A}{\rho}a_\rho = \frac{72.82}{\rho}a_\rho, \qquad D = \varepsilon_o E$$

At $\rho = 4$, $\underline{V = 9.52 \text{ V}}$, $\underline{\underline{E = 18.21}} a_\rho \underline{\text{ V/m}}$

$$D = \varepsilon_o E = \frac{10^{-9}}{36\pi} \times 18.21 a_\rho = 0.161 a_\rho \text{ nC}/\text{m}^2$$

Prob. 6.14

$$\nabla^2 V = 0 \qquad \longrightarrow \qquad V = -A/r + B$$

At $r=0.5$, $V=-50$ $\qquad \longrightarrow \qquad$ $-50 = -A/0.5 + B$

Or

$$-50 = -2A + B \qquad\qquad (1)$$

At $r = 1$, $V = 50$ $\longrightarrow$ $50 = -A + B$ (2)

From (1) and (2), $A = 100$, $B = 150$, and

$$V = -\frac{100}{r} + 150$$

$$E = -\nabla V = -\frac{A}{r^2}a_r = -\frac{100}{r^2}a_r \quad V/m$$

Prob. 6.15 From Example 6.4,

$$V = \frac{V_o \ln\left(\frac{\tan\theta/2}{\tan\theta_1/2}\right)}{\ln\left(\frac{\tan\theta_2/2}{\tan\theta_1/2}\right)}$$

$V_o = 100$, $\theta_1 = 30^o$, $\theta_2 = 120^o$, $r = \sqrt{3^2 + 0^2 + 4^2} = 5$, $\theta = \tan^{-1}\rho/z = \tan^{-1} 3/4 = 36.87^o$

$$V = 100 \frac{\ln\left(\frac{\tan 18.435^o}{\tan 15^o}\right)}{\ln\left(\frac{\tan 60^o}{\tan 15^o}\right)} = 11.7 \ V$$

$$E = \frac{-V_o a_\theta}{r\sin\theta \ln\left(\frac{\tan\theta_2/2}{\tan\theta_1/2}\right)} = \frac{-100 a_\theta}{5\sin 36.87^o \ln 6.464} = -17.86 a_\theta \ V/m$$

Prob. 6.16 (a)

$$\nabla^2 V = \frac{1}{\rho}\frac{\partial}{\partial\rho}\left(\rho\frac{\partial V}{\partial\rho}\right) = 0 \quad \longrightarrow \quad V = A\ln\rho + B$$

$V(\rho = b) = 0 \quad \longrightarrow \quad 0 = A\ln b + B \quad \longrightarrow \quad B = -A\ln b$

$V(\rho = b) = V_o \quad \longrightarrow \quad V_o = A\ln a/b \quad \longrightarrow \quad A = -\frac{V_o}{\ln b/a}$

$$V = -\frac{V_o}{\ln b/a}\ln\rho/b = \frac{V_o \ln b/\rho}{\ln b/a}$$

$$V(\rho = 15\text{mm}) = 70\frac{\ln 2}{\ln 50} = 12.4 \ V$$

(b) As the electron decelerates, potential energy gained = K.E. loss

$$e[70 - 12.4] = \frac{1}{2}m[(10^7)^2 - u^2] \quad \longrightarrow \quad 10^{14} - u^2 = \frac{2e}{m} \times 57.6$$

$$u^2 = 10^{14} - \frac{2 \times 1.6 \times 10^{-19}}{9.1 \times 10^{-31}} \times 57.6 = 10^{12}(100 - 20.25)$$

$$\underline{u = 8.93 \times 10^6 \ m/s}$$

Prob. 6.17 (a) For the parallel-plate capacitor,

$$E = -\frac{V_o}{d}a_x$$

From Example 6.11,

$$C = \frac{1}{V_o^2}\int \varepsilon |E|^2 dv = \frac{1}{V_o^2}\int \varepsilon \frac{V_o^2}{d^2}dv = \frac{\varepsilon}{d^2}Sd = \frac{\varepsilon S}{d}$$

(b) For the cylindrical capacitor,

$$E = -\frac{V_o}{\rho \ln b/a}a_\rho$$

From Example 6.8,

$$C = \frac{1}{V_o^2}\iiint \frac{\varepsilon V_o^2}{(\rho \ln b/a)^2}\rho d\rho d\phi dz = \frac{2\pi \varepsilon L}{(\ln b/a)^2}\int_a^b \frac{d\rho}{\rho} = \frac{2\pi \varepsilon L}{\ln b/a}$$

(c) For the spherical capacitor,

$$E = \frac{V_o}{r^2(1/a - 1/b)}a_r$$

From Example 6.10,

$$C = \frac{1}{V_o^2}\iiint \frac{\varepsilon V_o^2}{r^4(1/a - 1/b)^2}r^2 \sin\theta d\theta dr d\phi = \frac{\varepsilon}{(1/a - 1/b)^2}4\pi \int_a^b \frac{dr}{r^2} = \frac{4\pi\varepsilon}{\frac{1}{a} - \frac{1}{b}}$$

Prob. 6.18 This is similar to case 1 of Example 6.5.

$$X = c_1 x + c_2, \quad Y = c_3 y + c_4$$

But $\quad X(0) = 0 \quad \longrightarrow \quad 0 = c_2, \quad Y(0) = 0 \quad \longrightarrow \quad 0 = c_4$

Hence,

$$V(x,y) = XY = a_o xy, \quad a_o = c_1 c_3$$

Also, $V(xy = 4) = 20 \longrightarrow 20 = 4a_o \longrightarrow a_o = 5$

Thus,

$$V(x,y) = 5xy \text{ and } E = -\nabla V = -5ya_x - 5xa_y$$

At $(x,y) = (1,2)$,

$$V = 10 \text{ V}, \quad E = -10a_x - 5a_y \text{ V/m}$$

Prob. 6.19 (a) As in Example 6.5, $X(x) = A\sin(n\pi x/b)$

For Y,

$$Y(y) = c_1 \cosh(n\pi y/b) + c_2 \sinh(n\pi y/b)$$

$$Y(a) = 0 \longrightarrow 0 = c_1 \cosh(n\pi a/b) + c_2 \sinh(n\pi a/b) \longrightarrow c_1 = -c_2 \tanh(n\pi a/b)$$

$$V = \sum_{n=1}^{\infty} a_n \sin(n\pi x/b)\left[\sinh(n\pi y/b) - \tanh(n\pi a/b)\cosh(n\pi y/b)\right]$$

$$V(x, y = 0) = V_o = -\sum_{n=1}^{\infty} a_n \tanh(n\pi a/b)\sinh(n\pi x/b)$$

$$-a_n \tanh(n\pi a/b) = \frac{2}{b}\int_a^b V_o \sin(n\pi y/b)dy = \begin{cases} \dfrac{4V_o}{n\pi}, & n = \text{odd} \\ 0, & n = \text{even} \end{cases}$$

Hence,

$$V = -\frac{4V_o}{\pi}\sum_{n=\text{odd}}^{\infty} \sin(n\pi x/b)\left[\frac{\sin(n\pi y/b)}{n\tanh(n\pi a/b)} - \frac{\cosh(n\pi y/b)}{n}\right]$$

$$= -\frac{4V_o}{\pi}\sum_{n=\text{odd}}^{\infty}\frac{\sin(n\pi x/b)}{n\sinh(n\pi a/b)}\left[\sin(n\pi y/b)\cosh(n\pi a/b) - \cosh(n\pi y/b)\sinh(n\pi a/b)\right]$$

$$= -\frac{4V_o}{\pi}\sum_{n=\text{odd}}^{\infty}\frac{\sin(n\pi x/b)\sinh[n\pi(a-y)/b]}{n\sinh(n\pi a/b)}$$

Alternatively, for Y

$$Y(y) = c_1 \sinh n\pi(y - c_2)/b$$

$$Y(a) = 0 \quad \longrightarrow \quad 0 = c_1 \sinh[n\pi(a-c_2)/b] \quad \longrightarrow \quad c_2 = a$$

$$V = \sum_{n=1}^{\infty} b_n \sin(n\pi x/b)\sinh[n\pi(y-a)/b]$$

where

$$b_n = \begin{cases} -\dfrac{4V_o}{n\pi \, \sinh(n\pi a/b)}, & n = \text{odd} \\ 0, & n = \text{even} \end{cases}$$

(b) This is the same as Example 6.5 except that we exchange y and x. Hence

$$\underline{V(x,y) = \frac{4V_o}{\pi} \sum_{n=\text{odd}}^{\infty} \frac{\sin(n\pi y/a)\sinh n\pi x/a]}{n\sinh(n\pi b/a)}}$$

(c) This is the same as part (a) except that we must exchange x and y   Hence

$$\underline{V(x,y) = \frac{4V_o}{\pi} \sum_{n=\text{odd}}^{\infty} \frac{\sin(n\pi y/b)\sinh[n\pi(a-x)/b]}{n\sinh(n\pi a/b)}}$$

Prob. 6.20 (a) X(x) is the same as in Example 6.5. Hence

$$V(x,y) = \sum_{n=1}^{\infty} \sin(n\pi x/b)\left[a_n \sinh(n\pi y/b) + b_n \cosh(n\pi y/b)\right]$$

At y=0, $V = V_1$

$$V_1 = \sum_{n=1}^{\infty} b_n \sin(n\pi x/b) \quad \longrightarrow \quad b_n = \begin{cases} \dfrac{4V_1}{n\pi}, & n = \text{odd} \\ 0, & n = \text{even} \end{cases}$$

At y=a, $V = V_2$
$$V_2 = \sum_{n=1}^{\infty} \sin(n\pi x/b)\left[a_n \sinh(n\pi a/b) + b_n \cosh(n\pi a/b)\right]$$

$$a_n \sinh(n\pi a/b) + b_n \cosh(n\pi a/b) = \begin{cases} \dfrac{4V_2}{n\pi}, & n = \text{odd} \\ 0, & n = \text{even} \end{cases}$$

or

$$a_n = \begin{cases} \dfrac{4V_2}{n\pi \, \sinh(n\pi a/b)}\left(V_2 - V_1 \cosh(n\pi a/b)\right), & n = \text{odd} \\ 0, & n = \text{even} \end{cases}$$

Alternatively, we may apply superposition principle.

i.e. $V = V_A + V_B$

V_A is exactly the same as Example 6.5 with $V_o = V_2$, while V_B is exactly the same as Prob. 6.19(a). Hence

$$V = \frac{4}{\pi} \sum_{n=odd}^{\infty} \frac{\sin(n\pi x/b)}{n \sinh(n\pi a/b)} \left[V_1 \sinh[n\pi(a-y)/b] + V_2 \sinh(n\pi y/b) \right]$$

(b)

$$V(x,y) = (a_1 e^{-\alpha x} + a_2 e^{+\alpha x})(a_3 \sin\alpha y + a_4 \cos\alpha y)$$

$$\lim_{x \to \infty} V(x,y) = 0 \longrightarrow a_2 = 0$$

$$V(x, y=0) = 0 \longrightarrow a_4 = 0$$

$$V(x, y=a) = 0 \longrightarrow \alpha = n\pi/a, \quad n = 1,2,3,...$$

Hence,

$$V(x,y) = \sum_{n=1}^{\infty} a_n e^{-n\pi x/a} \sin(n\pi y/a)$$

$$V(x=0,y) = V_o = \sum_{n=1}^{\infty} a_n \sin(n\pi y/a) \longrightarrow a_n = \begin{cases} \dfrac{4V_o}{n\pi}, & n = \text{odd} \\ 0, & n = \text{even} \end{cases}$$

$$V(x,y) = \frac{4V_o}{\pi} \sum_{n=odd}^{\infty} \frac{\sin(n\pi y/a)}{n} \exp(-n\pi x/a)$$

(d) The problem is easily solved using superposition theorem, as illustrated below.

Therefore,

$$V = V_I + V_{II} + V_{III} + V_{IV}$$

where

$$V_I = \frac{4V_1}{\pi} \sum_{n=odd}^{\infty} \frac{\sin(m\pi x / b)\sinh[m\pi(a-y)/b]}{n\sinh(n\pi a / b)}$$

$$V_{II} = \frac{4V_2}{\pi} \sum_{n=odd}^{\infty} \frac{\sin(n\pi x / a)\sinh(n\pi y / a)}{n\sinh(m\pi b / a)}$$

$$V_{III} = \frac{4V_3}{\pi} \sum_{n=odd}^{\infty} \frac{\sin(n\pi x / b)\sinh(n\pi y / b)}{n\sinh(n\pi a / b)}$$

$$V_{IV} = \frac{4V_4}{\pi} \sum_{n=odd}^{\infty} \frac{\sin(n\pi y / a)\sinh[n\pi(b-x)/a]}{n\sinh(n\pi b / a)}$$

Prob. 6.21

$$\nabla^2 V = \frac{1}{\rho} \frac{\partial}{\partial \rho} \left(\rho \frac{\partial V}{\partial \rho} \right) + \frac{1}{\rho^2} \frac{\partial^2 V}{\partial \phi^2} = 0$$

If we let $V(\rho,\phi) = R(\rho)\Phi(\phi)$,

$$\frac{\Phi}{\rho} \frac{\partial}{\partial \rho}(\rho R') + \frac{1}{\rho^2} R\Phi'' = 0$$

or

$$\frac{\rho}{R} \frac{\partial}{\partial \rho}(\rho R') = -\frac{\Phi''}{\Phi} = \lambda$$

Hence

$$\underline{\underline{\Phi'' + \lambda \Phi = 0}}$$

and

$$\frac{\partial}{\partial \rho}(\rho R') - \frac{\lambda R}{\rho} = 0$$

or

$$\underline{\underline{R'' + \frac{R'}{\rho} - \frac{\lambda R}{\rho^2} = 0}}$$

Prob. 6.22

$$\nabla^2 V = \frac{1}{r^2} \frac{\partial}{\partial r} \left(r^2 \frac{\partial V}{\partial r} \right) + \frac{1}{r^2 \sin\theta} \frac{\partial}{\partial \theta}(\sin\theta \frac{\partial V}{\partial \theta}) = 0$$

If $V(r,\theta) = R(r)F(\theta)$, $r \neq 0$,

$$F \frac{d}{dr}(r^2 R') + \frac{R}{\sin\theta} \frac{d}{d\theta}(\sin\theta F') = 0$$

Dividing through by RF gives

$$\frac{1}{R} \frac{d}{dr}(r^2 R') = -\frac{1}{F \sin\theta} \frac{d}{d\theta}(\sin\theta F') = \lambda$$

Hence,

$$\sin\theta F'' + \cos\theta F' + \lambda F \sin\theta = 0$$

or

$$F'' + \cot\theta F' + \lambda F = 0$$

Also,

$$\frac{d}{dr}(r^2 R') - \lambda R = 0$$

or

$$R'' + \frac{2R'}{r} - \frac{\lambda}{r^2} R = 0$$

Prob. 6.23 If the centers at $\phi = 0$ and $\phi = \pi/2$ are maintained at a potential difference of V_o, from Example 6.3,

$$E_\phi = \frac{2V_o}{\pi\rho}, \quad J = \sigma E$$

Hence,

$$I = \int J \cdot dS = \frac{2V_o \sigma}{\pi} \int_{\rho=a}^{b} \int_{z=0}^{t} \frac{1}{\rho} d\rho dz = \frac{2V_o \sigma t}{\pi} \ln(b/a)$$

and

$$R = \frac{V_o}{I} = \frac{\pi}{2\sigma t \ln(b/a)}$$

Prob. 6.24 If $V(r = a) = 0$, $V(r = b) = V_o$, from Example 6.9,

$$E = \frac{V_o}{r^2(1/a - 1/b)}, \quad J = \sigma E$$

Hence,

$$I = \int J \cdot dS = \frac{V_o \sigma}{1/a - 1/b} \int_{\theta=0}^{\alpha} \int_{\phi=0}^{2\pi} \frac{1}{r^2} r^2 \sin\theta d\theta d\phi = \frac{2\pi V_o \sigma}{1/a - 1/b} (-\cos\theta)|_0^\alpha$$

$$R = \frac{V_o}{I} = \frac{\frac{1}{a} - \frac{1}{b}}{2\pi\sigma(1 - \cos\alpha)}$$

Prob. 6.25 For a spherical capacitor, from Eq. (6.38),

$$R = \frac{\frac{1}{a} - \frac{1}{b}}{4\pi\sigma}$$

For the hemisphere, $R' = 2R$ since the sphere consists of two hemispheres in parallel. As $b \longrightarrow \infty$,

$$R' = \lim_{b \longrightarrow x} \frac{\frac{1}{a} - \frac{1}{b}}{4\pi\sigma} = \frac{1}{2\pi a\sigma}$$

$$G = 1 / R' = 2\pi a\sigma$$

Alternatively, for an isolated sphere, $C = 4\pi\varepsilon a$. But

$$RC = \frac{\varepsilon}{\sigma} \longrightarrow R = \frac{1}{4\pi a\sigma}$$

$$R' = 2R = \frac{1}{2\pi a\sigma} \quad \text{or} \quad G = 2\pi a\sigma$$

$$\mathbf{H} = \int \frac{k\partial\mathbf{s} \times \mathbf{R}}{4\pi R^3}.$$

$\partial s = \partial x \partial y, \mathbf{k} = k_y \mathbf{a}_y,$

$\mathbf{R} = (-x, -y, h),$

$\mathbf{k} \times \mathbf{R} = (h\mathbf{a}_x + x\mathbf{a}_z)k_y,$

$$H = \int \frac{k_y(h\mathbf{a}_x + x\mathbf{a}_z)\partial x \partial y}{4\pi(x^2 + y^2 + h^2)^{3/2}} = \frac{k_y h\mathbf{a}_x}{4\pi} \int_{-x}^{x}\int_{-x}^{x} \frac{\partial x \partial y}{(x^2 + y^2 + h^2)^{3/2}} + \frac{k_y \mathbf{a}_z}{4\pi} \int_{-x}^{x}\int_{-x}^{x} \frac{x\partial x \partial y}{(x^2 + y^2 + h^2)^{3/2}}$$

The integrand in the last term is zero because it is an odd function of x.

$$H = \frac{k_y h\mathbf{a}_x}{4\pi} \int_{\phi=0}^{2\pi}\int_{\rho=0}^{x} \frac{\rho\partial\phi\partial\rho}{(\rho^2 + h^2)^{3/2}} = \frac{k_y h 2\pi \mathbf{a}_z}{4\pi} \int_{0}^{x} (\rho^2 + h^2)^{-3/2} \frac{\partial(\rho^2)}{2}$$

$$= \frac{k_y h}{2}\mathbf{a}_z \left(\frac{-1}{(\rho^2 + h^2)^{1/2}} \right)\Big|_0^x = \frac{k_y}{2}\mathbf{a}_z$$

Similarly, for point (0,0,-h), $H = -\frac{1}{2}k_y\mathbf{a}_x$

Hence,

$$H = \begin{bmatrix} \frac{1}{2}k_y\mathbf{a}_x, & z>0 \\ \frac{1}{2}k_y\mathbf{a}_x, & z<0 \end{bmatrix}$$

(b)

For $\rho < a$, $\oint \overline{H} \cdot dl = I_{enc} = 0 \rightarrow \overline{H} = 0$

For $0 < \rho < b$, $H_\phi \cdot 2\pi\rho = \dfrac{I\pi(\rho^2 - a^2)}{\pi(b^2 - a^2)}$

$$H_\phi = \frac{I}{2\pi\rho}\left(\frac{\rho^2 - a^2}{b^2 - a^2}\right)$$

For $\rho < b$, $H_\phi \cdot 2\pi\rho = I \rightarrow \overline{H}_\phi = \dfrac{I}{2\pi\rho}$

Thus,

$$H_\phi = \begin{cases} 0, & \rho < a \\ \dfrac{I}{2\pi\rho}\left(\dfrac{\rho^2 - a^2}{b^2 - a^2}\right), & a < \rho < 1 \\ \dfrac{I}{2\pi\rho}, & \rho > b \end{cases}$$

CHAPTER 8

P.E. 8.1

(a) $F = m\dfrac{\partial \bar{u}}{\partial t} = Q\bar{E} = \underline{\underline{6\bar{a}_z N}}$

(b) $\dfrac{\partial \bar{u}}{\partial t} = 6\bar{a}_z = \dfrac{\partial}{\partial t}(u_x, u_y, u_z) \Rightarrow$

$\dfrac{\partial u_x}{\partial t} = 0 \rightarrow u_x = A$

$\dfrac{\partial u_y}{\partial t} = 0 \rightarrow u_y = B$

$\dfrac{\partial u_z}{\partial t} = 6 \rightarrow u_z = 6t + C$

Since $\bar{u}(t = 0) = 0$, $\qquad A = B = C = 0$

$u_x = 0 = u_y, \quad u_z = 6t$

$u_x \dfrac{\partial x}{\partial t} = 0 \rightarrow x = A$

$u_y \dfrac{\partial y}{\partial t} = 0 \rightarrow y = B$

$u_z \dfrac{\partial z}{\partial t} = 6t \rightarrow z = 3t^2 + C_1$

At $t = 0$, $(x,y,z) = (0,0,0) \rightarrow A_1 = 0 = B_1 = C_1$

Hence , $(x,y,z) = (0,0,3t^2)$,

$u = 6t a_z$ at any time. At P(0,0,12), $z = 12 = 3t^2 \rightarrow t = 2s$

$$\underline{t = 2s}$$ '

(c) $u = 6t\bar{a}_z = 12a_z m/s$.

$a = \dfrac{\partial \bar{U}}{\partial t} = \underline{\underline{6a_z \, m/s^2}}$

(d) $K.E = \dfrac{1}{2}m|\bar{U}|^2 = \dfrac{1}{2}(1)(144) = \underline{\underline{72J}}$

P.E. 8.2

(a) $\qquad m\bar{a} = e\bar{u}xB = (eB_ouy, -eB_oux, 0)$

$$\dfrac{d^2x}{dt^2} = \dfrac{eBo}{m}\dfrac{dy}{dt} = w\dfrac{dy}{dt} \qquad\qquad (1)$$

$$\frac{d^2 y}{dt^2} = -\frac{eBo}{m}\frac{dx}{dt} = -w\frac{dx}{dt} \qquad (2)$$

$$\frac{d^2 z}{dt^2} = 0; \Rightarrow \frac{dz}{dt} = C_1 \qquad (3)$$

From (1) and (2),

$$\frac{d^3 x}{dt^3} = w\frac{d^2 y}{dt^2} = -w^2 \frac{dx}{dt}$$

$$(D^2 + w^2 D)x = 0 \rightarrow Dx = (0, \pm jw)x$$

$$x = c_2 + c_3 \cos wt + c_4 \sin wt$$

$$\frac{dy}{dt} = \frac{1}{w}\frac{d^2 x}{dt^2} = -c_3 w \cos twt - c_4 w \sin wt$$

At $t = 0$, $\vec{u} = (\alpha, 0, \beta)$. Hence,

$$c_1 = \beta, c_3 = 0, c_4 = \frac{\alpha}{w}$$

$$\frac{dx}{dt} = \alpha \cos wt, \frac{dy}{dt} = -\alpha \sin wt, \frac{dz}{dt} = \beta$$

(b)   Solving these yields

$$x = \frac{a}{w}\sin wt, y = \frac{\alpha}{w}\cos wt, z = \beta t$$

(c) $x^2 + y^2 = \dfrac{\alpha^2}{w^2}$, z=βt

showing that the particles move along a helix of radius α/w placed along the z-axis.

P.E. 8.3

(d) $\quad \nabla \bullet D = \dfrac{1}{r^2 \sin\theta} \sin(\omega t - 5r) \dfrac{\partial}{\partial\theta}(\sin^2\theta) \neq 0$

$$\nabla x D = -\frac{\partial D_\theta}{\partial\phi} a_r + \frac{1}{r}\frac{\partial}{\partial r}(rD_\theta)a_\phi = \frac{1}{r}\sin\theta(-5)\sin(\omega t - 5r)a_\phi \neq 0$$

<u>No</u>, D is not an EM field.

Prob. 9.26   From Maxwell's equations,

$$\nabla \times \bar{E} = -\frac{\partial \bar{B}}{\partial t} \tag{1}$$

$$\nabla \times \bar{H} = \bar{J} + \frac{\partial \bar{D}}{\partial t} \tag{2}$$

Dotting both sides of (2) with $\bar{E}$ gives:

$$\bar{E} \bullet (\nabla \times \bar{H}) = \bar{E} \bullet \bar{J} + \bar{E} \bullet \frac{\partial \bar{D}}{\partial t} \tag{3}$$

But for any arbitrary vectors $\bar{A}$ and $\bar{B}$,

$$\nabla \bullet (\bar{A} \times \bar{B}) = \bar{B} \bullet (\nabla \times \bar{A}) - \bar{A} \bullet (\nabla \times \bar{B})$$

Applying this on the left-hand side of (3) by letting $\bar{A} \equiv \bar{B}$ and $\bar{B} \equiv \bar{E}$, we get

$$\bar{H} \bullet (\nabla \times \bar{E}) + \nabla \bullet (\bar{H} \times \bar{E}) = \bar{E} \bullet \bar{J} + \tfrac{1}{2}\frac{\partial}{\partial t}(\bar{D} \bullet \bar{E}) \tag{4}$$

From (1),

$$\bar{H} \bullet (\nabla \times \bar{E}) = \bar{H} \bullet \left(-\frac{\partial \bar{B}}{\partial t}\right) = \tfrac{1}{2}\frac{\partial}{\partial t}(\bar{B} \bullet \bar{H})$$

Substituting this in (4) gives:

$$-\tfrac{1}{2}\frac{\partial}{\partial t}(\bar{B} \bullet \bar{H}) - \nabla \bullet (\bar{E} \times \bar{H}) = \bar{J} \bullet \bar{E} + \tfrac{1}{2}\frac{\partial}{\partial t}(\bar{D} \bullet \bar{E})$$

Rearranging terms and then taking the volume integral of both sides:

$$\int_v \nabla \bullet (\bar{E} \times \bar{H})dv = -\frac{\partial}{\partial t}\tfrac{1}{2}\int_v(\bar{E} \bullet \bar{D} + \bar{H} \bullet \bar{B})dv - \int_v \bar{J} \bullet \bar{E}dv$$

$$\oint_s (\bar{E} \times \bar{H}) \bullet dS = -\frac{\partial w}{\partial t} - \int_v \bar{J} \bullet \bar{E}dv$$

or $\dfrac{\partial w}{\partial t} = -\oint_s (\bar{E} \times \bar{H}) \bullet dS - \int_v \bar{E} \bullet \bar{J}dv$ as required.

$$\nabla \cdot D = \rho_v / \varepsilon = 0, \qquad \nabla \cdot B = 0$$

$$\nabla x E = -\frac{\partial B}{\partial t}, \qquad \nabla x H = J + \frac{\partial D}{\partial t}$$

We write these in phasor form and in terms of E_s and H_s only.

$$\nabla \cdot E_s = 0 \qquad\qquad (1)$$

$$\nabla \cdot H_s = 0 \qquad\qquad (2)$$

$$\nabla x E_s = -j\omega\mu H_s \qquad\qquad (3)$$

$$\nabla x H_s = (\sigma + j\omega\varepsilon)E_s \qquad\qquad (4)$$

Taking the curl of (3),

$$\nabla x \nabla x E_s = -j\omega\mu \nabla x H_s$$

$$\nabla(\nabla \cdot E_s) - \nabla^2 E_s = -j\omega\mu(\sigma + j\omega\varepsilon)E_s$$

Prob. 11.46

At $z = 0, t = 0^+$, $v_o = \dfrac{Z_o}{Z_o + Z_g}V_g$

$t_1 = \dfrac{l}{u} = $ transit time or time delay. Hence,

$$V(l, t_1^+)$$

$$V(l, t_1^+) = V_o + \Gamma_L V_o$$

$$V(l, t_1^+) = V_o + \Gamma_L V_o$$

$$V(l, 3t_1^+) = V_o + \Gamma_L V_o + \Gamma_G \Gamma_L V_o$$

$$V(l, 5t_1^+) = V_o + \Gamma_L V_o + \Gamma_G \Gamma_L V_o + \Gamma_G \Gamma_L^2 V_o$$

$$V(l, 7t_1^+) = V_o\left(1 + \Gamma_L + \Gamma_G \Gamma_L + \Gamma_G \Gamma_L^2 + \Gamma_G^2 \Gamma_L^2\right)$$

and so on. When $t \gg \dfrac{l}{u}$

$$V(l,\infty) = V_0 \left[1 + \Gamma_G \Gamma_L + (\Gamma_G \Gamma_L)^2 + (\Gamma_G \Gamma_L)^3 + ... \right]$$
$$+ V_0 \Gamma_L \left[1 + \Gamma_G \Gamma_L + (\Gamma_G \Gamma_L)^2 + (\Gamma_G \Gamma_L)^3 + ... \right]$$

But $1 + x + x^2 + x^3 + ... = \dfrac{1}{1-x}$ $|x| < 1$.

Since $|\Gamma_G \Gamma_L| < 1$,

$$V(l,\infty) = V_0 \left[\frac{1}{1 - \Gamma_G \Gamma_L} + \frac{\Gamma_L}{1 - \Gamma_G \Gamma_L} \right] = V_0 \frac{(1 + \Gamma_L)}{1 - \Gamma_G \Gamma_L}$$

Thus

$$V_\infty = \frac{V_g Z_L}{Z_L + Z_G}, \qquad I_\infty = \frac{V_\infty}{Z_L} = \frac{V_g}{Z_L + Z_G}$$

Prob. 11.47

We only need the voltage bounce diagram because we can obtain $I(l, t)$ from $V(l, t)/Z_L$.

(Voltage bounce diagram)

$$V_{\infty} = \frac{Z_{L}}{Z_{g} - Z_{L}}V_{g} = \frac{0.5}{2.5}(27) = 5.4\text{ V}, \quad l_{\infty} = \frac{V_{\infty}}{Z_{L}} = 216\text{ mA}$$

The voltage and current bounce diagram are shown below

(Voltage bounce diagram)   (Current bounce diagram)

From the bounce diagram, we obtain V(0,t) and I(0,t) as shown below:

$$\boxed{\textbf{Prob.11.49}} \quad V_o = \frac{Z_0}{Z_0 + Z_g} V_g = \frac{75}{75 + 54}(100) = 60$$

$$t_1 = \frac{1}{u} = \frac{200}{2 \times 10^8} = 1\mu s$$

$$\Gamma_g = \frac{Z_g - Z_0}{Z_g + Z_0} = \frac{50 - 75}{50 + 75} = -\frac{1}{5}, \quad \Gamma_L = \frac{Z_1 - Z_0}{Z_1 - Z_0} = \frac{150 - 75}{150 + 75} = \frac{1}{3}$$

The voltage bounce diagram is shown below.

From the bounce diagram, we obtain V(l,t) as shown below.

Since

$I(l,t) = \dfrac{V(l,t)}{150}$, we obtain I(l,t) by scaling V(l,t) down by 150.

The result is shown below.

$$f_{c11} = \frac{u'}{2}\sqrt{\frac{1}{a^2} + \frac{1}{b^2}} = \frac{3x10^8 x10^2}{2}\sqrt{1/8.636^2 + 1/4.318^2} = 3.883 \quad \text{GHz}$$

$$u_p = \frac{3x10^8}{\sqrt{1 - (3.883/4)^2}} = \underline{\underline{12.5x10^8}} \quad \text{m/s},$$

$$u_g = \frac{9x10^{16}}{12.5x10^6} = \underline{\underline{7.203x10^7}} \quad \text{m/s}$$

P. E. 12.5 The dominant mode becomes TE_{01} mode

$$f_{c01} = \frac{c}{2b} = 3.75 \quad \text{GHz}, \quad \eta_{TE} = 406.7\Omega$$

From Example 12.2,

$$E_x = -E_o \sin(3\pi y / b)\sin(\omega t - \beta z), \quad \text{where} \quad E_o = \frac{\omega\mu b}{\pi} H_o.$$

$$\mathcal{P}_{ave} = \int_{x=0}^{a} \int_{y=0}^{b} \frac{|E_{xs}|^2}{2\eta}dxdy = \frac{E_o^2 ab}{4\eta}$$

Hence $E_o = 63.77$ V/m as in Example 12.5.

$$H_o = \frac{\pi E_o}{\omega\mu b} = \frac{\pi x63.77}{2\pi x10^{10} x4\pi x10^{-7} x4x10^{-2}} = \underline{\underline{63.34}} \quad \text{mA/m}$$

P. E. 12.6 (a) For m=1, n=0, $f_c = u'/(2a)$

$$\frac{\sigma}{\omega\varepsilon} = \frac{10^{-15}}{2\pi x9x10^9 x2.6x10^{-9}/(36\pi)} = \frac{10^{-15}}{1.3} << 1$$

Hence,

$$u' \cong \frac{1}{\sqrt{\mu\varepsilon}} = c / \sqrt{2.6}, \quad f_c = \frac{3x10^8}{2x2.4x10^{-2}\sqrt{2.6}} = 3.876 \quad \text{GHz}$$

$$\alpha_d = \frac{\sigma \eta'}{2\sqrt{1-(f_c/f)^2}} = \frac{10^{-15} \times 377/\sqrt{2.6}}{2\sqrt{1-(3.876/9)^2}} = 1.295 \times 10^{-13} \text{ Np/m}$$

For n = 0, m=1,

$$\alpha_c = \frac{2R_s}{b\eta'\sqrt{1-(f_c/f)^2}}[\frac{1}{2} + \frac{b}{a}(f_c/f)^2]$$

$$= $$

$$\frac{2\sqrt{2.6}\sqrt{\pi \times 9 \times 10^9 \times 1.1 \times 10^7 \times 4\pi \times 10^{-7}}}{377 \times 1.5 \times 10^{-2} \times 1.1 \times 10^7 \sqrt{1-(3.876/9)^2}}[0.5 + (2.4/1.5)(3.876/9)^2] = \underline{3.148 \times 10^{-2}} \text{ Np/m}$$

(∴)Since $\alpha_c \gg \alpha_d, \alpha = \alpha_c + \alpha_d \cong \alpha_c = 3.148 \times 10^{-2}$

loss $= \alpha l = 3.148 \times 10^{-2} \times 0.4 = 1.259 \times 10^{-2}$ Np $= \underline{0.1093 \text{ dB}}$

P. E. 12.7 For TM$_{11}$, m = 1 = n,

$$E_{zs} = E_o \sin(\pi x/a)\sin(\pi y/b)e^{-\gamma z}$$

$$E_{xs} = -\frac{\gamma}{h^2}(\pi/a)E_o \cos(\pi x/a)\sin(\pi y/b)e^{-\gamma z}$$

$$E_{ys} = -\frac{\gamma}{h^2}(\pi/b)E_o \sin(\pi x/a)\cos(\pi y/b)e^{-\gamma z}$$

$$H_{xs} = \frac{j\omega\varepsilon}{h^2}(\pi/b)E_o \sin(\pi x/a)\cos(\pi y/b)e^{-\gamma z}$$

$$H_{ys} = -\frac{j\omega\varepsilon}{h^2}(\pi/a)E_o \cos(\pi x/a)\sin(\pi y/b)e^{-\gamma z}$$

$$H_{zs} = 0$$

For the electric field lines,

$$\frac{dy}{dx} = \frac{E_y}{E_x} = (a/b)\tan(\pi x/a)\cot(\pi y/b)$$

For the magnetic field lines

$$\frac{dy}{dx} = \frac{H_y}{H_x} = -(a/b)\cot(\pi x/a)\tan(\pi y/b)$$

Notice that $(\dfrac{E_y}{E_x})(\dfrac{H_y}{H_x}) = -1$

showing that the electric and magnetic field lines are mutually orthogonal. The field

lines are as shown in Fig. 12.14.

A design could be <u>a = 9mm, b = 3mm.</u>

Prob. 12.5 For the dominant mode,

$$f_c = \frac{c}{2a} = \frac{3x10^8}{2x8} = 18.75\,MHz$$

(a) It <u>will not pass</u> the AM signal, (b) it <u>will pass</u> the FM signal.

Prob. 12.6 (a) For TE_{10} mode, $f_c = \dfrac{u'}{2a}$

Or $a = \dfrac{u'}{2f_{c10}} = \dfrac{3x10^8}{2x5x10^9} = \underline{3\ cm}$

For TE_{01} mode, $f_c = \dfrac{u'}{2b}$

Or $b = \dfrac{u'}{2f_c} = \dfrac{3x10^8}{2x12x10^9} = \underline{1.25\ cm}$

(b) Since $a > b$, $1/a < 1/b$, the next higher modes are calculated as shown below.

Mode	f_c (GHz)
TE_{10}	5

TE_{30}	15
TE_{40}	20
*TE_{01}	12
TE_{02}	24
*TE_{11}	13
TE_{21}	15.62

The next three higher modes are starred ones, i.e. TE_{20}, TE_{01}, TE_{11}

(c) $u' = \dfrac{1}{\sqrt{\mu\varepsilon}} = \dfrac{c}{\sqrt{2.25}} = 2x10^8$ m/s

For TE_{11} modes,

$$f_c = \frac{3x10^8}{2x10^{-2}\sqrt{2.25}} \sqrt{\frac{1}{3^2} + \frac{1}{1.25^2}} = \underline{8.67}\ GHz$$

Prob. 12.7

unit pattern   group pattern

For the group pattern, the nulls are at

$$\frac{\pi}{4}(\cos\theta - 1) = \pm\frac{\pi}{2}, \pm\frac{3\pi}{2} \quad \longrightarrow \quad \theta = 180°$$

and maxima at

$$\cos\theta - 1 = 0 \qquad\longrightarrow\qquad \theta = 0$$

Thus the group pattern and the resultant patterns are as shown in Fig.13.15(b)

Thus, we take a pair at a time and multiply the patterns as shown below.

The group pattern is the normalized array factor, i.e.

$$(AF)_n = \frac{1}{\sum}\left|1 + Ne^{i\psi} + \frac{N(N-1)}{2!}e^{i2\psi} + \frac{N(N-1)(N-2)}{3!}e^{i3\psi} + \ldots\ldots\ldots + e^{i(N-1)\psi}\right|$$

where $\displaystyle\sum = \sum_{i=1}^{N-1}\binom{N}{i} = 1 + N + \frac{N-1}{2!} + \frac{N(N-1)(N-2)}{3!} + \ldots\ldots$

$$= (1+1)^{N-1} = 2^{N-1}$$

$$(AF)_n = \frac{1}{2^{N-1}}\left|1 + e^{j\psi}\right|^{N-1} = \frac{1}{2^{N-1}}\left|e^{j\psi/2}\right|\left|e^{-j\psi/2} + e^{j\psi/2}\right|^{N-1}$$

$$\sin\theta = 0 \qquad \theta = -1 \quad \text{or} \quad \theta = 180^\circ$$

Alternatively $f(\theta)$ can be plotted using Matlab or Maple.
The group pattern is shown below.

(b) For $d = \dfrac{\lambda}{2}$, $f(\theta) = \cos\left[\dfrac{1}{2}\left(\dfrac{2\pi}{\lambda}\cdot\dfrac{\lambda}{2}\cos\theta + \dfrac{\pi}{2}\right)\right]$

The group pattern is sketched below.

Prob. 13.28

$$f(\theta) = \cos\left[\frac{1}{2}\left(\beta d \cos\theta + \alpha\right)\right]$$

(a) $\alpha = \pi/2, \beta d = \frac{2\pi}{\lambda}.\lambda = 2\pi$

$$f(\theta) = \cos\left(\pi \cos\theta + \pi/4\right)$$

Nulls occur at $\pi \cos\theta + \pi/4 = \pm\dfrac{\pi}{2}, \pm\dfrac{3\pi}{2}, \ldots$ or $\theta = 75.5°, 138.6°$

Maxima occur at $\dfrac{\partial f}{\partial \theta} = 0 \longrightarrow \sin\theta = 0 \longrightarrow \theta = 0°, 180°$

Or $\sin\left(\pi \cos + \dfrac{\pi}{4}\right) = 0 \longrightarrow \theta = 41.4°, 104.5°$

With $f_{max} = 0.71, 1$.

Hence the group pattern is sketched below.

(b) $\alpha = \dfrac{3\pi}{4}, \beta d = \dfrac{2\pi}{\lambda} \cdot \dfrac{\lambda}{4} = \dfrac{\pi}{2}$

Nulls occur at $\dfrac{\pi}{4}\cos\theta + \dfrac{3\pi}{8} = \pm\dfrac{\pi}{2}, \pm\dfrac{3\pi}{2}, \dots \quad \longrightarrow \quad \theta = 60°$

Maxima and minima occur at $\sin\theta \sin\left(\dfrac{\pi}{4}\cos\theta + \dfrac{3\pi}{8} \right) = 0$

i.e. $\theta = 0°, 180° \rightarrow f(\theta) = 0.383, 0.924$

(c) $\alpha = 0, \beta d = \dfrac{2\pi}{\lambda} \cdot \dfrac{3\lambda}{4} = \dfrac{3\pi}{2}$

$$f(\theta) = \left| \cos\left(\dfrac{3\pi}{4} \cos\theta \right) \right|$$

It has nulls at $\dfrac{3\pi}{4} \cos\theta = \pm \dfrac{\pi}{2}, \pm \dfrac{3\pi}{2}, \dots \rightarrow \theta = 48.2^{\circ}, 131.8^{\circ}$

It has maxima and minima at $\dfrac{df}{d\theta} = 0 \rightarrow \sin\theta \sin\left(\dfrac{3\pi}{4} \cos\theta \right) = 0$

i.e. $\theta = 0^{\circ}, 180^{\circ} \rightarrow f(\theta) = 0.71, 1$

$$\sin\left(\frac{\pi}{4}\cos\theta\right) \to \cos = 0 \to \theta = 90^{o}, f(\theta) = 1$$

Nulls occur as $\frac{\pi}{4}Cos\theta = \pm\frac{\pi}{2}, \pm\frac{3\pi}{2}, \dots$ (No Solution)

The group pattern is sketched below.

(b) For N = 4,

$$AF = \frac{\sin 2(\beta d \cos\theta + 0)}{\sin\frac{1}{2}(\beta d \cos\theta + 0)}$$

Now, $\frac{\sin 4\theta}{\sin\theta} = \frac{2\sin 2\theta \cos 2\theta}{\sin\theta} = 4\cos 2\theta \cos\theta$

$$AF = 4\cos(\beta d \cos\theta)\cos\left(\frac{1}{2}\beta d \cos\theta\right)$$

$$f(\theta) = \cos\left(\frac{2\pi}{\lambda} \cdot \frac{\lambda}{4}\cos\theta\right)\cos\left(\frac{1}{2}\frac{2\pi}{\lambda}\frac{\lambda}{4}\right)\cos\theta$$

i.e. $\underline{63.1\%}$

Prob. 14.1 Microwave is used:
(1) For surveying land with a piece of equipment called the *tellurometer*. This radar system can precisely measure the distance between two points.
(2) For guidance. The guidance of missiles, the launching and homing guidance of space vehicles, and the control of ships are performed with the aid of microwaves
(3) In semiconductor devices. A large number of new microwave semiconductor devices have been developed for the purpose of microwave oscillator, amplification, mixing/detection, frequency multiplication, and switching. Without such achievement, the majority of today's microwave systems could not exist.

Prob. 14.2 (a) In terms of the S-parameters, the T-parameters are given by

$T_{11} = 1/S_{21}, \; T_{12} = -S_{22}/S_{21}, \; T_{21} = S_{11}/S_{21}, \; T_{22} = S_{12} - S_{11} S_{22}/S_{21}$

(b) $T_{11} = 1/0.4 = 2.5, \quad T_{12} = -0.2/0.4,$

$T_{21} = 0.2/0.4, \quad T_{22} = 0.4 - 0.2 \times 0.2/0.4 = 0.3$

Hence,

$$T = \begin{bmatrix} 2.5 & 0.5 \\ -0.5 & 0.3 \end{bmatrix}$$

Prob. 14.3 Since $Z_L = Z_o$, $\Gamma_L = 0$.

$$\Gamma_i = S_{11} = \underline{0.33 - j0.15}$$

$$\Gamma_g = (Z_g - Z_o)/(Z_g + Z_o) = (2-1)/(2+1) = 1/3$$

$$\Gamma_o = S_{22} - S_{12}S_{21}\Gamma_g \cdot (1 - S_{11}\Gamma_g)$$

$$= 0.44 - j0.62 + 0.56\text{x}0.56 \text{ x}(1/3)/[1 - (0.11 - j0.05)]$$

$$= \underline{0.5571 - j0.6266}$$

Prob. 14.4 The microwave wavelengths are of the same magnitude as the circuit components. The wavelength in air at a microwave frequency of 300 GHz, for example, is 1 mm. The physical dimension of the lumped element must be in this range to avoid interference. Also, the leads connecting the lumped element probably have much more inductance and capacitance than is needed.

Prob. 14.5

$$\lambda = c/f = \frac{3x10^8}{8.4x10^9} = \underline{3.571 \text{ mm}}$$

Prob. 14.6

$i_c + i_R = 0$; hence $Cdv/dt + v/R = 0$

or $dv/v = - dt/RC$

so that $\ln v = -t/\tau + \ln v_o$, $\tau = RC = 125 \times 10^{-12} \times 2 \times 10^3 = 0.5 \, \mu s$

$v = v_o e^{-t/\tau}$, $v(0) = v_o = 1500$

$$i_c = C \, dv/dt = C \, (-1/\tau) \, v_o e^{-t/\tau} = \frac{-125x10^{-12}}{0.5x10^{-6}} \times 1500 \, e^{-t/\tau}$$

$$= \underline{-0.375e^{-t/\tau} \, A, \quad \tau = 0.5 \, \mu s}$$

Prob. 14.7

By definition

$$V_1 = AV_2 - BI_2 \qquad\qquad (1)$$
$$I_1 = CV_2 - DI_2 \qquad\qquad (2)$$

We eliminate I_1 and I_2.

$$V_g = V_1 + Z_g I_1 \quad \text{or} \quad I_1 = (V_g - V_1)/Z_g \qquad (3)$$

$$V_2 = -Z_L I_2 \quad \text{or} \quad I_2 = -V_2/Z_L \qquad\qquad (4)$$

Substituting (3) and (4) into (1) and (2) and expressing V_1 and V_2 in terms of V_g, we obtain

$$IL = 20 \log V_1 / V_2 = 20 \log_{10} \left| \frac{AZ_L + B + CZ_g Z_L + DZ_g}{Z_g + Z_L} \right|$$

Prob. 14.8

(a) $R_{dc} = \dfrac{l}{\sigma S} = \dfrac{10^3}{0.96x10^{-4} \, x6.1x10^7} = \underline{16.73 \, m\Omega \, /km}$

(b) $R_{ac} = \dfrac{l}{\delta w \sigma}, \quad \pi a^2 = 0.8 \times 1.2 = 0.96 \text{ or } a = 0.5528$

$$\delta = \frac{1}{\sqrt{\pi f \mu \sigma}} = \frac{1}{\sqrt{\pi X 6 x 10^6 \, x 4\pi x 10^{-7} \, x 6.1 x 10^7}} = \frac{1}{12\pi x 10^3}$$

$$R_{ac} = \frac{1000 x 12\pi x 10^3}{1.2 x 10^{-2} \, x 6.1 x 10^7} = \underline{51.5 \, \Omega}$$

Prob. 14.9

$$n = c/u_m = \frac{3x10^8}{2.1x10^8} = \underline{1.428}$$

Prob. 14.10 When an optical fiber is used as the transmission medium, cable radiation is eliminated. Thus, optical fibers offer total EMI isolation because they neither emit nor pick up EM waves.

Prob. 14.11

(a) $NA = \sqrt{n_1^2 - n_2^2} = \sqrt{1.62^2 - 1.604^2} = \underline{0.2271}$

(b) $NA = \sin \theta_a = 0.2271$ or $\theta_a = \sin^{-1} 0.2271 = \underline{13.13^o}$

(c) $V = \frac{\pi d}{\lambda} NA = \frac{\pi x 50 x 10^{-6} x 0.2271}{1300 x 10^{-9}} = 27.441$

$N = V^2/2 = \underline{376 \text{ modes}}$

Prob. 14.12

(a) $V = \frac{\pi d}{\lambda} \sqrt{n_1^2 - n_2^2} = \frac{\pi x 2.5 x 10^{-6} x 2}{1.3 x 10^{-6}} \sqrt{1.45^2 - 1^2} = \underline{12.69}$

(b) $NA = \sqrt{n_1^2 - n_2^2} = \sqrt{1.45^2 - 1^2} = \underline{1.05}$

(c) $N = V^2/2 = \underline{80 \text{ modes}}$

Prob. 14.13

(a) $NA = \sin \theta_a = \sqrt{n_1^2 - n_2^2} = \sqrt{1.53^2 - 1.45^2} = 0.4883$
$\theta_a = \sin^{-1} 0.4883 = \underline{29.23^o}$

(b) $P(l)/P(0) = 10^{-\alpha l / 10} = 10^{-0.4 X 5/10} = 0.631$

i.e. $\underline{63.1 \%}$

Prob. 14.14

$P(l) = P(0) e^{-\alpha l/10} = 10e^{-0.5 x 0.85/10} \text{ mW} = \underline{9.584 \text{ mW}}$

Prob. 14.15 As shown in Eq. (10.35), $\log_{10} P_1/P_2 = 0.434 \ln P_1/P_2$,

$1 \text{ Np} = 20 \log_{10} e = 8.686 \text{ dB}$ or $1 \text{ Np/km} = 8.686 \text{ dB/km}$.

or $1 \text{Np/m} = 8686 \text{ dB/km}$. Thus,

$$\alpha_{10} = \underline{\underline{8686}} \; \alpha_{14}$$

Prob. 14.16

$P(0) = P(l) \, e^{\alpha \, l/10} = 0.2 \, e^{0.4 \times 30/10} \text{ mW} = \underline{0.664 \text{ mW}}$

Prob. 14.17   See text.

CHAPTER 15

P. E. 15.1   The program in Fig. 15.3 was used to obtain the plot in Fig. 15.5.

P. E. 15.2   For the exact solution,

$(D^2 + 1) y = 0 \quad \longrightarrow \quad y = A \cos x + B \sin x$

$y(0) = 0 \longrightarrow A = 0$

$y(1) = 1 \longrightarrow 1 = B \sin 1 \text{ or } B = 1/\sin 1$

Thus, $y = \sin x/\sin 1$

For the finite difference solution,

$$y'' + y = 0 \quad \longrightarrow \quad \frac{y(x + \Delta) - 2y(x) + y(x - \Delta)}{\Delta^2} + y = 0$$

or

$$y(x) = \frac{y(x + \Delta) + y(x - \Delta)}{2 - \Delta^2}, y(0) = 0, y(1) = 1, \Delta = 1/4$$

With the Fortran program shown below, we obtain the exact result y_e and FD result y.

```
      DIMENSION
      Y(0) = 0.0
      Y(4) = 1.0
      DEL = 0.25
      DO 10 N = 1,20  ! N = NO. OF ITERATIONS
      DO 10  I = 1,3
      Y(I) = ( Y(I+1) + Y(I-1) )/(2.0 – DEL*DEL)
      X = FLOAT (I)*DEL
      YE = SIN(X)/SIN(1.0)
      PRINT *, N, I, Y(I), YE
   10 CONTINUE
      STOP
      END
```

The results are listed below.

y(x)	N=5	N=10	N=15	N=20	Exact $y_e(x)$
y(0.25)	0.2498	0.2924	0.2942	0.2943	0.2941
y(0.5)	0.5242	0.5682	0.5701	0.5701	0.5697

P. E. 14.3 By applying eq. (15.16) to each node as shown below, we obtain the following results after 5 iterations.

P. E. 15.4 (a) Using the program in Fig. 15.16 with NX = 4 and NY = 8, we obtain the potential at center as

$$
C = \begin{bmatrix} C^{(1)}{}_{11} + C_{11}{}^{(2)} & C_{12}{}^{(2)} & C_{12}{}^{(1)} + C_{13}{}^{(2)} & C_{13}{}^{(1)} \\ C_{21}{}^{(2)} & C_{22}{}^{(2)} & C_{23}{}^{(2)} & 0 \\ C_{21}{}^{(1)} + C_{31}{}^{(2)} & C_{32}{}^{(2)} & C_{22}{}^{(1)} + C_{33}{}^{(2)} & C_{23}{}^{(1)} \\ C_{31}{}^{(1)} & 0 & C_{32}{}^{(2)} & C_{33}{}^{(1)} \end{bmatrix}
$$

$$
= \begin{bmatrix} 0.9964 & 0.05 & -0.2464 & -0.8 \\ 0.05 & 0.7 & 0.75 & 0 \\ -0.2464 & 0.75 & 1.596 & -0.6 \\ -0.8 & 0 & -0.6 & 1.4 \end{bmatrix}
$$

(b)

For element 1, local 1-2-3 corresponds with global 1-2-4 and $A_1 = 0.675$,

$P_1 = 0.8$, $P_2 = -0.9$, $P_3 = 0.4$, $Q_1 = -0.5$, $Q_2 = 1.5$, $Q_3 = -1.0$

$$
C^{(2)} = \begin{bmatrix} 0.5933 & -0.9800 & 0.3867 \\ -0.9800 & 2.040 & -1.060 \\ 0.3867 & -1.060 & 0.6733 \end{bmatrix}
$$

For element 2, local 1-2-3 corresponds with global 2-3-4 and $A_2 = 0.375$,

$P_1 = 0.1$, $P_2 = 1.4$, $P_3 = -1.5$, $Q_1 = -1$, $Q_2 = 0$, $Q_3 = 1$

$$
C^{(1)} = \begin{bmatrix} 0.3607 & 0.05 & -0.4107 \\ 0.05 & 0.7 & -0.75 \\ -0.4107 & -0.75 & 1.1607 \end{bmatrix}
$$

The global coefficient matrix is

$$
C = \begin{bmatrix}
C^{(1)}_{11} & C_{12}^{(1)} & 0 & C_{13}^{(1)} \\
C_{21}^{(1)} & C_{22}^{(1)} + C_{11}^{(2)} & C_{12}^{(2)} & C_{23}^{(1)} + C_{13}^{(2)} \\
0 & C_{12}^{(2)} & C_{22}^{(2)} & C_{23}^{(2)} \\
C_{31}^{(1)} & C_{32}^{(1)} + C_{31}^{(2)} & C_{32}^{(2)} & C_{33}^{(1)} + C_{33}^{(2)}
\end{bmatrix}
$$

$$
= \begin{bmatrix}
1.333 & -0.0777 & 0 & -1.056 \\
-0.0777 & 0.8192 & -0.98 & 0.2386 \\
0 & -0.98 & 2.04 & -01.06 \\
-1.056 & 0.2386 & -1.06 & 1.877
\end{bmatrix}
$$

P. E. 15.7 We use the FORTRAN program in Fig. 15.34. The input data for the region in Fig. 14.35 is a follows:

       0.0 0.0 0.0];

With this data, the finite element (FEM) solution is compared with the finite

difference (FD) solution as shown below.

Node #	x	y	FEM	FD
5	1.5	0.5	11.265	11.25
10	1.5	1.0	15.06	15.02
13	0.5	1.5	4.958	4.705

15	1.0	1.5	18.97	18.84
18	0.5	2.0	10.04	9.659
19	1.0	2.0	15.22	14.85
20	1.5	2.0	21.05	20.87

Prob. 15.1 (a) Using the Matlab code in Fig. 15.3, we input the data as:

```
>> plotit( [-1 2 1], [-1 0; 0 2; 1 0], 1, 1, 0.01, 0.01, 8, 2, 5 )
```

and the plot is shown below.

(b) Using the Matlab code in Fig. 15.3, we input the required data as:

>> plotit([1 1 1 1 1], [-1 -1; -1 1; 1 -1; 1 1; 0 0], 1, 1, 0.02, 0.01, 6, 2, 5)

and obtain the plot shown below.

Prob. 15.2

Exact solution: $y = Ax + B$

$x = 0, y = 0 \longrightarrow B = 0; \quad x = 1, y = 10 \longrightarrow A = 10$

$y = 10x; \qquad y(0.25) = \underline{2.5}$

Finite difference solution:

$$\frac{d^2 y}{dx^2} \cong \frac{y(x + \Delta) - 2y(x) + y(x - \Delta)}{\Delta^2} = 0$$

or

$$y(x) = \frac{1}{2}[y(x + \Delta) + y(x - \Delta)], \Delta = 0.25$$

Using this scheme, we obtain the result shown below.

	0	0.25	0.5	0.75	1.0
Iteration					
0	0	0	0	0	10
1	0	0	0	5	10
2	0	0	2.5	7.5	10
3	0	1.25	5.0	8.75	10
4	0	2.5	5.625	7.5	10
5	0	2.8125	5.0	7.8125	10
6	0	2.5	5.3125	7.5	10
...	...	...	...	...	...

From this, we obtain $y(0.25) = \underline{2.5.}$

Prob. 15.3 (a)

$$\frac{dV}{dx} = \frac{V(x_o + \Delta x) - V(x - \Delta x)}{2\Delta x}$$

For $\Delta x = 0.05$ and at $x = 0.15$,

398 A

$$\frac{dV}{dx} = \frac{2.0134 - 1.00}{0.05 \times 2} = \underline{\underline{10.117}}$$

$$\frac{d^2V}{dx^2} = \frac{V(x + \Delta x) - 2V(x_o) + V(x_o - \Delta x)}{(\Delta x)^2} = \frac{2.0134 + 1.0017 - 2 \times 1.5056}{(0.05)^2} = \underline{\underline{1.56}}$$

(b) $V = 10 \sinh x$, $dV/dx = 10 \cosh x$. At $x = 0.15$, $dV/dx = \underline{10.113}$

which is close to the numerical estimate.

$d^2V/dx^2 = 10 \sinh x$. At $x = 0.15$, $d^2V/dx^2 = \underline{1.5056}$

which is lower than the numerical value.

Prob. 15.4

$$\nabla^2 V = \frac{\partial^2 V}{\partial \rho^2} + \frac{1}{\rho}\frac{\partial V}{\partial \rho} + \frac{\partial^2 V}{\partial z^2} = 0$$

The equivalent finite difference expression is

$$\frac{V(\rho_o + \Delta\rho, z_o) - 2V(\rho_o, z_o) + V(\rho_o - \Delta\rho, z_o)}{(\Delta\rho)^2} + \frac{1}{\rho_o}\frac{V(\rho_o + \Delta\rho, z_o) - V(\rho_o + \Delta\rho, z_o)}{2\Delta\rho}$$

$$+ \frac{V(\rho_o, z_o + \Delta z) - 2V(\rho_o, z_o) + V(\rho_o, z_o - \Delta z)}{(\Delta z)^2} = 0$$

If $\Delta z = \Delta\rho = h$, rearranging terms gives

$$V(\rho_o, z_o) = \frac{1}{4}V(\rho_o, z_o + h) + \frac{1}{4}V(\rho_o, z_o - h) + (1 + \frac{h}{2\rho_o})V(\rho + h, z_o)$$

$$+ (1 - \frac{h}{2\rho_o})V(\rho - h, z_o)$$

as expected.

Prob. 15.5

$$\nabla^2 V = \frac{\partial^2 V}{\partial \rho^2} + \frac{1}{\rho}\frac{\partial V}{\partial \rho} + \frac{1}{\rho^2}\frac{\partial^2 V}{\partial \phi^2} = 0. \tag{1}$$

as expected.

Prob. 15.5

$$\nabla^2 V = \frac{\partial^2 V}{\partial \rho^2} + \frac{1}{\rho}\frac{\partial V}{\partial \rho} + \frac{1}{\rho^2}\frac{\partial^2 V}{\partial \phi^2} = 0, \tag{1}$$

$$\frac{\partial^2 V}{\partial \rho^2} = \frac{V_{m+1}^{\,n} - 2V_m^{\,n} + V_{m+1}^{\,n}}{(\Delta \rho)^2}, \tag{2}$$

$$\frac{\partial^2 V}{\partial \phi^2} = \frac{V_m^{\,n+1} - 2V_m^{\,n} + V_m^{\,n-1}}{(\Delta \phi)^2}, \tag{3}$$

$$\frac{\partial V}{\partial \rho}\Big|_{m,n} = \frac{V_{m+1}^{\,n} - V_{m-1}^{\,n}}{2\Delta \rho}. \tag{4}$$

Substituting (2) to (4) into (1) gives

$$\nabla^2 V = \frac{V_{m+1}^{\,n} - V_{m-1}^{\,n}}{m\Delta \rho (2\Delta \rho)} + \frac{V_{m+1}^{\,n} - 2V_m^{\,n} + V_{m+1}^{\,n}}{(\Delta \rho)^2} + \frac{V_m^{\,n+1} - 2V_m^{\,n} + V_m^{\,n-1}}{(m\Delta \rho \Delta \phi)^2}$$

$$= \frac{1}{(\Delta \rho)^2}\left[(1 - \frac{1}{2m})V_{m-1}^{\,n} - 2V_m^{\,n} + (1 + \frac{1}{2m})V_{m-1}^{\,n} + \frac{1}{(m\Delta \phi)^2}(V_m^{\,n+1} - 2V_m^{\,n} + V_m^{\,n-1}) \right]$$

as required.

Prob. 15.6

$$V_o = \frac{V_1 + V_2 + V_3 + V_4}{4} = \frac{-10 + 0 + 30 + 60}{4} = 20\ \text{V}$$

Prob. 15.7

$$V_1 = 0.25\,(V_2 + 30 + 0 - 20) = V_2/4 + 2.5 \tag{1}$$

$$V_2 = 0.25\,(V_1 + 20 + 0 + 30) = V_1/4 + 12.5 \tag{2}$$

Substituting (2) into (1),

$$V_1 = 2.5 + V_1/16 + 3.125 \quad \longrightarrow \quad V_1 = 6\ \text{V}$$

$$\frac{\partial^2 V}{\partial \rho^2} = \frac{V_{m+1}{}^n - 2V_m{}^n + V_{m+1}{}^n}{(\Delta \rho)^2}, \qquad (2)$$

$$\frac{\partial^2 V}{\partial \phi^2} = \frac{V_m{}^{n+1} - 2V_m{}^n + V_m{}^{n-1}}{(\Delta \phi)^2}, \qquad (3)$$

$$\frac{\partial V}{\partial \rho}\Big|_{m,n} = \frac{V^n{}_{m+1} - V^n{}_{m-1}}{2\Delta \rho}. \qquad (4)$$

Substituting (2) to (4) into (1) gives

$$\nabla^2 V = \frac{V^n{}_{m+1} - V^n{}_{m-1}}{m\Delta\rho(2\Delta\rho)} + \frac{V_{m+1}{}^n - 2V_m{}^n + V_{m+1}{}^n}{(\Delta\rho)^2} + \frac{V_m{}^{n+1} - 2V_m{}^n + V_m{}^{n-1}}{(m\Delta\rho\Delta\phi)^2}$$

$$= \frac{1}{(\Delta\rho)^2}\left[(1 - \frac{1}{2m})V_{m-1}{}^n - 2V_m{}^n + (1 + \frac{1}{2m})V_{m-1}{}^n + \frac{1}{(m\Delta\phi)^2}(V_m{}^{n+1} - 2V_m{}^n + V_m{}^{n-1})\right]$$

as required.

Prob. 15.6

$$V_o = \frac{V_1 + V_2 + V_3 + V_4}{4} = \frac{-10 + 0 + 30 + 60}{4} = \underline{\underline{20}} \text{ V}$$

Prob. 15.7

$$V_1 = 0.25\,(V_2 + 30 + 0 - 20) = V_2/4 + 2.5 \qquad (1)$$

$$V_2 = 0.25\,(V_1 + 20 + 0 + 30) = V_1/4 + 12.5 \qquad (2)$$

Substituting (2) into (1),

$$V_1 = 2.5 + V_1/16 + 3.125 \longrightarrow V_1 = \underline{6 \text{ V}}$$

$$V_2 = V_1/4 + 12.5 = \underline{14 \text{ V}}$$

Prob. 15.8

$$k = \frac{h^2 \rho_o}{\varepsilon_o} = \frac{10^{-2} x \dfrac{100}{\pi} x 10^{-9}}{\dfrac{10^{-9}}{36\pi}} = 36$$

$$V_1 = \frac{1}{4}(V_2 + 30 + 0 \div 20 + k) = V_2/4 + 11.5 \qquad (1)$$

$$V_2 = \frac{1}{4}(V_1 + 20 + 0 + 30 + k) = V_1/4 + 21.5 \qquad (2)$$

Substituting (2) into (1) gives

$$V_1 = 11.5 + V_1/16 + 5.375 \longrightarrow V_1 = \underline{18\ V}$$

$$V_2 = V_1/4 + 12.5 = \underline{26\ V}$$

Prob. 15.9 (a)

$$V_1 = \frac{1}{4}(0 + 100 + V_3 + V_2), \quad V_2 = \frac{1}{4}(0 + 100 + V_1 + V_4),$$

$$V_3 = \frac{1}{4}(0 + 0 + V_1 + V_4), \quad V_4 = \frac{1}{4}(0 + 0 + V_2 + V_3)$$

We apply these iteratively $n=5$ times and obtain the result below.

n	0	1	2	3	4	5
V_1	0	25	34.375	36.72	37.305	37.45
V_2	0	31.25	35.937	37.11	37.403	37.475
V_3	0	6.25	10.937	12.11	12.403	12.475
V_4	0	9.375	11.917	12.305	12.45	12.487

(b) By band matrix method,

$$4V_1 - V_2 - V_3 = 100$$

$$-V_1 + 4V_2 - V_4 = 100$$

$$-V_1 + 4V_3 - V_4 = 0$$

$$-V_2 - V_3 + 4V_3 = 0$$

In matrix form,

$$\begin{bmatrix} 4 & -1 & -1 & 0 \\ -1 & 4 & 0 & -1 \\ -1 & 0 & 4 & -1 \\ 0 & -1 & -1 & 4 \end{bmatrix} \begin{bmatrix} V_1 \\ V_2 \\ V_3 \\ V_4 \end{bmatrix} = \begin{bmatrix} 100 \\ 100 \\ 0 \\ 0 \end{bmatrix}$$

$$A V = B \longrightarrow V = A^{-1} B$$

which yields $\underline{V_1 = 37.5 = V_2, \quad V_3 = 12.5 = V_4.}$

These values are more accurate than those obtained in part(a). Why? The average of

the values should give 25 V which is the potential at the center of the region. The

values in part(a) give 24.96 V while the value in part (b) gives 25.

$$\qquad\qquad [A] \qquad\qquad\qquad\qquad [B]$$

Prob. 15.11 (a) Matrix [A] remains the same. To each term of matrix [B], we add

$-h^2 \rho_s / \varepsilon$.

(b) Let $\Delta x = \Delta y = h = 0.05$ so that $NX = 20 = NY$.

$$\frac{\rho_s}{\varepsilon} = \frac{x(y-1)10^{-9}}{10^{-9}/36\pi} = 36\pi x(y-1)$$

Modify the program in Fig. 15.16 as follows.

```
DO 40  I=1, NX –1
DO 40  J=1, NY-1
SAVE = V(I,J)
X = H*FLOAT(I)
Y=H*FLOAT(J)
RO = 36.0*PIE*X*(Y-1)
V(I,J) = 0.25*( V(I+1,J) + V(I-1,J) + V(I,J+1) + V(I,J-1) + H*H* ᴐ )
40  CONTINUE
```

This is the major change. However, in addition to this, we must set

```
      V1 = 0.0
      V2 = 10.0
      V3 = 20.0
      V4 = -10.0
      NX = 20
      NY = 20
```

The results are:

$\underline{V_a = 4.276, V_b = 9.577, V_c = 11.126, V_d = -2.013, V_e = 2.919,}$

$\underline{V_f = 6.069, V_g = -3.424, V_h = -0.109, V_i = 2.909}$

Prob. 15.12

$$\frac{1}{c^2} \frac{\Phi^{J+1}_{m,n} + \Phi^{J-1}_{m,n} - 2\Phi^{J}_{m,n}}{(\Delta t)^2} = \frac{\Phi^{J}_{m+1,n} + \Phi^{J}_{m-1,n} - 2\Phi^{J}_{m,n}}{(\Delta x)^2}$$

$$+ \frac{\Phi^{J}_{m,n+1} + \Phi^{J}_{m,n-1} - 2\Phi^{J}_{m,n}}{(\Delta z)^2}$$

If $h = \Delta x = \Delta z$, then after rearranging we obtain

$$\Phi^{J+1}{}_{m,n} = 2\Phi^{J+1}{}_{m,n} - \Phi^{J-1}{}_{m,n} + \alpha(\Phi^{J}{}_{m,n} + \Phi^{J}{}_{m-1,n} - 2\Phi^{J}{}_{m,n})$$

$$\alpha(\Phi^{J}{}_{m,n+1} + \Phi^{J}{}_{m,n-1} - 2\Phi^{J+1}{}_{m,n})$$

where $\alpha = (c\Delta t / h)^2$.

(a)Points 1, 3, 5, and 7 are equidistant from O. Hence

$$V_o = \frac{1}{4}(V_1 + V_3 + V_5 + V_7) \qquad (1)$$

Also points 2, 4, 6, and 8 are equidistant from O so that

$$V_o = \frac{1}{4}(V_2 + V_4 + V_6 + V_8) \qquad (2)$$

Adding (1) and (2) gives

as required.

Prob. 15.15 Combining the ideas in the programs in Figs. 15.20 and 15.24, we develop a Matlab code which gives

$$N = 40 \longrightarrow C = 13.55 \text{ pF/m}$$

$$N = 100 \longrightarrow \underline{C = 12.77 \text{ pF/m}}$$

For the exact value, $d/2a = 50/10 = 5$

$$C = \frac{\pi \varepsilon}{\cosh^{-1} \dfrac{d}{2a}} = \frac{\pi x 10^{-9} / 36\pi}{\cosh^{-1} 5} = \underline{\underline{12.12}} \text{ pF/m}$$

Prob. 15.16   To determine V and **E** at (-1,4,5), we use the program in Fig. 15.21.

$$V = \frac{\Delta}{4\pi\varepsilon} \sum_{k=1}^{N} \frac{\rho_k}{\sqrt{26 + (y - y_k)^2}}$$

$$E = \int_0^{L} \frac{\rho_L dl R}{4\pi\varepsilon_o R^3}$$

where **R** = **r** – **r'** = (-1, 4-y', 5), R = |**R**|

$$E_x \cong \frac{\Delta}{4\pi\varepsilon} \sum_{k=1}^{N} \frac{(-1)\rho_k}{[26 + (4 - y_k)^2]^{3/2}}$$

$$E_y \cong \frac{\Delta}{4\pi\varepsilon} \sum_{k=1}^{N} \frac{(4 - y_k)\rho_k}{[26 + (4 - y_k)^2]^{3/2}}$$

$$E_z = -5E_x$$

For N = 20, V_o = 1V, L = 1m, a = 1mm, the following lines are added to the program in

Prob. 15.17

To find C, take the following steps:

(1) Divide each line into N equal segments. Number the segments in the lower conductor as 1, 2, ..., N and segments in the upper conductor as N+1, N+2, ..., 2N,

(2) Determine the coordinate (x_k, y_k) for the center of each segment.

For the lower conductor, $y_k = 0$, k=1, ..., N, $x_k = h + \Delta (k-1/2)$, k = 1,2,... N

For the upper conductor, $x_k = [h + \Delta (k-1/2)] \sin \theta$, k=N+1, N+2, ...,2 N,

$x_k = [h + \Delta (k-1/2)] \cos \theta$, k = N+1,N+2,... 2N

where h is determined from the gap g as

$$h = \frac{g}{2\sin\theta/2}$$

(3) Calculate the matrices [V] and [A] with the following elements

$$V_k = \begin{cases} V_o, k = 1,...,N \\ -V_o, k = N+1,...2N \end{cases}$$

$$A_{ij} = \begin{cases} \dfrac{\Delta}{4\pi\varepsilon R_{ij}}, i \neq j \\ 2\ln\Delta / a, i = j \end{cases}$$

where $R_{ij} = \sqrt{(x_i - x_j)^2 + (y_i - y_j)^2}$

(4) Invert matrix [A] and find $[\rho] = [A]^{-1} [V]$.

(5) Find the charge Q on one conductor

$$Q = \sum \rho_k \Delta = \Delta \sum_{k=1}^{N} \rho_k$$

(6) Find $C = |Q|/V_0$

Prob. 15.18 We may modify the program in Fig. 15.25 and obtain $Z_o \cong 50\Omega$. For details, see M. N. O. Sadiku, "Numerical Techniques in Electromagnetics," (CRC Press, 1992), pp. 338-340.

Prob. 15.19 (a) Exact solution yields

$C = 2\pi\varepsilon / In(\Delta / a) = 8.02607 \times 10^{-11}$ F/m and $Z_o = 41.559\Omega$

Prob. 15.20 We modify the Matlab code in Fig. 15.26 (for Example 15.5) by changing

the input data and matrices [A] and [B]. We let

$x_i = h + \Delta (i-1/2)$, $i = 1,2,... N$, $\Delta = L/N$

$y_i = h /2$, $j = 1,2,... N$, $z_k = t/2$, $k = 1,2,... N$

and calculate

$$R_y = \sqrt{(x_i - x_j)^2 + (y_i - y_j)^2 + (z_i - z_j)^2}$$

We obtain matrices [A] and [B]. Inverting [A] gives

$[q] = [A]^{-1} [B]$, $[\rho_v] = [q]/(ht \Delta)$, $C = \dfrac{\sum_{i=1}^{N} q_i}{10}$

The computed values of $[\rho_v]$ and C are shown below.

Prob. 15.21   From given figure, we obtain

$$\alpha_1 = \frac{A_1}{A} = \frac{1}{2A}\begin{vmatrix} 1 & x & y \\ 1 & x_2 & y_2 \\ 1 & x_3 & y_3 \end{vmatrix} = \frac{1}{2A}[(x_2 y_3 - x_3 y_2) + (y_2 - y_3)x + (x_3 - x_2)y]$$

as expected. The same applies for α_2 and α_3.

Prob. 15.22   (a) For the element in (a),

A = ½ (1 – 0.5x0.25) = 0.4375

$$\alpha_1 = \frac{1}{2A}[0.875 - 0.75x - 0.5y] = 1 - 0.8571x - 0.5714y$$

$$\alpha_2 = \frac{1}{2A}[0 + x - 0.5y] = 1.1428x - 0.5714y$$

$$\alpha_3 = \frac{1}{2A}[0 - 0.25x + y] = -0.2857x + 1.1429y$$

For the element in (b),

A = ½ [0.5x1.6 – (-1)x1.6] = 1.2

$\alpha_1 = 1.25 - 0.625y$

$\alpha_2 = -1.5 + 0.667x + 0.4167y$

$\alpha_3 = 1.25 - 0.667x + 0.2083y$

(b)For the element in (a),

   $P_1 = -0.75$, $P_2 = 1.0$, $P_3 = -0.25$, $Q_1 = -0.5 = Q_2$, $Q_3 = 1.0$

$$C_{ij} = \frac{1}{4A}[P_i P_i + Q_i Q_j] = (\nabla \alpha_1 . \nabla \alpha_2)A$$

   Hence,

$$C^{(1)} = \begin{bmatrix} 0.4643 & -0.2857 & -0.1786 \\ -0.2857 & 0.7143 & -0.4286 \\ -0.1786 & -0.4286 & 0.6071 \end{bmatrix}$$

For the element in (b),

$P_1 = 0, P_2 = 1.6, P_3 = -1.6, Q_1 = -1.5, Q_2 = 1.0, Q_3 = 0.5$

Hence,

$$C^{(2)} = \begin{bmatrix} 0.4688 & -0.3125 & -0.1553 \\ -0.3125 & 0.7417 & -0.4292 \\ -0.1563 & -0.4292 & 0.5854 \end{bmatrix}$$

Prob. 15.23 (a)

$$2A = \begin{vmatrix} 1 & 1/2 & 1/2 \\ 1 & 3 & 1/2 \\ 1 & 2 & 2 \end{vmatrix} = 15/4$$

$$\alpha_1 = \frac{4}{15}[(6-1) + (-1\frac{1}{2})x + (-1)y] = \frac{4}{15}(5 - 1.5x - y)$$

$$\alpha_2 = \frac{4}{15}[(1-1) + \frac{3}{2}x - \frac{3}{2}y] = \frac{4}{15}(1.5x - 1.5y)$$

$$\alpha_3 = \frac{4}{15}[(1/4 - 3/2) + 0x + \frac{5}{2}y] = \frac{4}{15}(-1.25 + 2.5y)$$

$V = \alpha_1 V_1 + \alpha_2 V_2 + \alpha_3 V_3$

Substituting V=80, $V_1 = 100$, $V_2 = 50$, $V_3 = 30$, α_1, α_2, and α_3 leads to

$20 = 7.5x + 10y + 3.75$

Along side 12, y=1/2 so that

$20 = 15x/2 + 5 + 15/4$ $\longrightarrow$ x=3/2, i.e (1.5, 0.5)

Along side 13, x =y

$20 = 15x/2 + 10x + 15/4$ $\longrightarrow$ x=13/4, i.e. (13/14, 13/14)

Along side 23, $y = -3x/2 + 5$

$20 = 15x/2 - 15 + 50 + 15/4$ $\longrightarrow$ $x = -5/2$ (not possible)

Hence intersection occurs at

(1.5, 0.5) along 12 and (0.9286, 0.9286) along 13

(b) At (2,1),

$$\alpha_1 = \frac{4}{15}, \quad \alpha_2 = \frac{6}{15}, \quad \alpha_3 = \frac{5}{15}$$

$V(1,2) = \alpha_1 V_1 + \alpha_2 V_2 + \alpha_3 V_3 = (400 + 300 + 150)/15 = \underline{56.67\text{ V}}$

Prob. 15.24

$$2A = \begin{vmatrix} 1 & 0 & 0 \\ 1 & 2 & -1 \\ 1 & 1 & 4 \end{vmatrix} = 9$$

$$\alpha_1 = \frac{1}{9}[(0-0) + (4-0)x + (0-1)y] = \frac{1}{9}(4x - y)$$

$$\alpha_2 = \frac{1}{9}[(0-0) + (0+1)x + (2-0)y] = \frac{1}{9}(x + 2y)$$

$$\alpha_3 = \frac{1}{9}[(8+1) + (-1-4)x + (1-2)y] = \frac{1}{9}(9 - 5x - y)$$

$$V_e = \alpha_1 V_{e1} + \alpha_2 V_{e2} + \alpha_{31} V_{e3}$$

$V(1,2) = 8(4-2)/9 + 12(1+4)/9 + 10(9-5-1)/9 = 96/9 = \underline{10.667\text{ V}}$

At the center $\alpha_1 = \alpha_2 = \alpha_3 = 1/3$ so that

$V(\text{center}) = (8 + 12 + 10)/3 = 10$

Or at the center, $(x, y) = (0 + 1 + 2, 0 + 4 - 1)/3 = (1,1)$

$V(1,1) = 8(3)/9 + 12(3)/9 + 10(3)/9 = 10\text{ V}$

Prob. 15.25

For element 1, local numbering 1-2-3 corresponds to global numbering 4-2-1.

$P_1 = 12, P_2 = 0, P_3 = -12, Q_1 = -3, Q_2 = 8, Q_3 = -5,$

$A = (0 + 12 \times 8)/2 = 48$

$$C_y = \frac{1}{4x48}[P_j P_i + Q_j Q_j]$$

$$C^{(1)} = \begin{bmatrix} 0.7956 & -0.1248 & -0.6708 \\ -0.1248 & 0.3328 & -0.208 \\ -0.6708 & -0.208 & 0.8788 \end{bmatrix}$$

For element 2, local numbering 1-2-3 corresponds to global numbering 2-4-3.

$P_1 = -12, P_2 = 0, P_3 = 12, Q_1 = 0, Q_2 = -5, Q_3 = 5,$

$A = (0 + 60)/2 = 30$

$$C_y = \frac{1}{4x48}[P_j P_i + Q_j Q_j]$$

$$C^{(1)} = \begin{bmatrix} 1.2 & 0 & -1.2 \\ 0 & 0.208 & -0.208 \\ -1.2 & -0.208 & 1.408 \end{bmatrix}$$

$$C = \begin{bmatrix} C^{(1)}_{33} & C_{23}^{(1)} & 0 & C_{31}^{(1)} \\ C_{23}^{(1)} & C_{22}^{(1)} + C_{11}^{(2)} & C_{13}^{(2)} & C_{21}^{(1)} + C_{12}^{(2)} \\ 0 & C_{31}^{(2)} & C_{33}^{(2)} & C_{32}^{(2)} \\ C_{13}^{(1)} & C_{21}^{(1)} + C_{21}^{(2)} & C_{23}^{(2)} & C_{22}^{(2)} + C_{11}^{(1)} \end{bmatrix}$$

$$= \begin{bmatrix} 0.8788 & -0.208 & 0 & -0.6708 \\ -0.208 & 1.528 & -1.2 & -0.1248 \\ 0 & -1.2 & 1.408 & -0.206 \\ -0.6708 & -0.1248 & -0.208 & 1.0036 \end{bmatrix}$$

Prob. 15.26

For element 1, local numbering 1-2-3 corresponds to global numbering 1-2-4.

$P_1 = -2, P_2 = 1, P_3 = -1; Q_1 = 1, Q_2 = -2, Q_3 = 1,$

$A = (P_2 Q_3 - P_3 Q_2)/2 = 3/2$, i.e. $4A = 6$

$$C_{ij} = \frac{1}{4A}[P_j P_i + Q_j Q_i]$$

$$C^{(1)} = \frac{1}{6}\begin{bmatrix} 5 & -4 & -1 \\ -4 & 5 & -1 \\ -1 & -1 & 2 \end{bmatrix}$$

For element 2, local numbering 1-2-3 corresponds to global numbering 4-2-3.
$P_1 = 0, P_2 = -2, P_3 = 2, Q_1 = 2, Q_2 = -1, Q_3 = -1,$

A = 2, 4A = 8

$$C^{(2)} = \frac{1}{8}\begin{bmatrix} 4 & -2 & -2 \\ -2 & 5 & -3 \\ -2 & -3 & 5 \end{bmatrix}$$

The global coefficient matrix is

$$C = \begin{bmatrix} C^{(1)}_{11} & C^{(1)}_{12} & 0 & C^{(1)}_{13} \\ C^{(1)}_{12} & C^{(1)}_{22} + C^{(2)}_{22} & C^{(2)}_{23} & C^{(1)}_{23} + C^{(2)}_{21} \\ 0 & C^{(2)}_{23} & C^{(2)}_{33} & C^{(2)}_{31} \\ C^{(1)}_{13} & C^{(1)}_{23} + C^{(2)}_{21} & C^{(2)}_{31} & C^{(1)}_{33} + C^{(2)}_{11} \end{bmatrix}$$

$$= \begin{bmatrix} 0.8333 & -0.667 & 0 & -0.1667 \\ -0.6667 & 1.4583 & -0.375 & -0.4167 \\ 0 & -0.375 & 0.625 & -0.25 \\ -0.1667 & -0.4167 & -0.25 & 0.833 \end{bmatrix}$$

Prob. 15.27 We can do it by hand as in Example 15.6. However, it is easier to prepare

an input files and use the program in Fig. 15.54. The Matlab input data is

```
NE = 2;
ND = 4;
NP = 2;
NL = [1  2  4
      2  3  4];
X = [ 0.0   1.0   3.0   2.0];
Y = [ 1.0  0.0  0.0  2.0];
NDP= [ 1  3 ];
VAL = [ 10.0   30.0]
```

The result is $V = \begin{bmatrix} 10 \\ 18 \\ 30 \\ 20 \end{bmatrix}$

From this,

$$V_2 = 18 \text{ V}, \quad V_4 = 20 \text{ V}$$

Prob. 15.28

The local numbering 1-2-3 in element 3 corresponds with the global numbering 5-4-1, while the local number 1-2-3 in element 4 corresponds with t'.e global numbering 5-1-2.

$$C_{5,5} = C_{11}^{(2)} + C_{11}^{(3)} + C_{11}^{(4)} + C_{11}^{(5)}, \quad A = 2,$$

$$C_{11}^{(2)} = (2 \times 2 + 2 \times 2)/8 = 1 = C_{11}^{(5)}$$

$$C_{11}^{(3)} = (2 \times 2 + 0)/8 = \frac{1}{2} = C_{11}^{(4)}$$

$$C_{5,5} = 1 + 1 + \frac{1}{2} + \frac{1}{2} = \underline{3}$$

$$C_{5,1} = C_{31}^{(3)} + C_{21}^{(4)}$$

But $C_{31}^{(3)} = \frac{1}{8}(P_3 P_1 + Q_3 Q_1) = 0$ since $P_3 = 0 = Q_3$

$C_{21}^{(4)} = \frac{1}{8}(P_2 P_1 + Q_2 Q_1) = 0$ since $P_3 = 0 = Q_3$

$\underline{C_{5,1} = 0}$

Prob. 15.31

For element 1, the local numbering 1-2-3 corresponds with nodes with V_1, V_2, and V_3.

$$V_o = -\frac{1}{C_{oo}} \sum_{i=1}^{4} V_i C_{io}$$

$$C_{oo} = \sum_{j=1}^{4} C_{oj}^{(e)} = \frac{1}{4h^2/2}(hh + hh)x2 + \frac{1}{4h^2/2}(hh + 0)x4 = 4$$

$$C_{o1} = \frac{2x1}{2h^2}[P_3 P_1 + Q_3 Q_1] = \frac{2}{2h^2}[-hh - 0] = -1$$

$$C_{o2} = \frac{2x1}{2h^2}[P_1 P_2 + Q_1 Q_2] = \frac{2}{2h^2}[-hx0 + hx(-h)] = -1$$

Similarly, $C_{03} = -1 = C_{04}$. Thus

$$V_o = (V_1 + V_2 + V_3 + V_4)/4$$

which is the same result obtained using FDM.
